TMS320DM814x DaVinci™ Video Processors

Check for Samples: TMS320DM8148, TMS320DM8147

1 High-Performance System-on-Chip (SoC)

1.1 Features

- High-Performance DaVinci Video Processors
  - Up to 1-GHz ARM® Cortex®-A8 RISC Core
  - Up to 750-MHz C674x™ VLIW DSP
  - Up to 6000 MIPS and 4500 MFLOPS
  - Fully Software-Compatible with C67x+™, C64x+™
- ARM Cortex-A8 Core
  - ARMv7 Architecture
    - In-Order, Dual-Issue, Superscalar Processor Core
    - Neon™ Multimedia Architecture
    - Supports Integer and Floating Point
    - Jazelle® RCT Execution Environment
- ARM Cortex-A8 Memory Architecture
  - 32KB of Instruction and Data Caches
  - 512KB of L2 Cache
  - 64KB of RAM, 48KB of Boot ROM
- TMS320C674x Floating-Point VLIW DSP
  - 64 General-Purpose Registers (32-Bit)
  - Six ALU (32-/40-Bit) Functional Units
    - Supports 32-Bit Integer, SP (IEEE Single Precision/32-Bit) and DP (IEEE Double Precision/64-Bit) Floating Point
    - Supports up to Four SP Adds Per Clock and Four DP Adds Every Two Clocks
    - Supports up to Two Floating-Point (SP or DP) Approximate Reciprocal or Square Root Operations Per Cycle
  - Two Multiply Functional Units
    - Mixed-Precision IEEE Floating-Point Multiply Supported up to:
      - 2 SP x SP → SP Per Clock
      - 2 SP x SP → DP Every Two Clocks
      - 2 SP x DP → DP Every Three Clocks
      - 2 DP x DP → DP Every Four Clocks
    - Fixed-Point Multiply Supports Two 32 x 32 Multiplies, Four 16 x 16-Bit Multiplies Including Complex Multiplies, or Eight 8 x 8-Bit Multiplies per Clock Cycle
- C674x Two-Level Memory Architecture
  - 32KB of L1P RAM/Cache With EDC
  - 32KB of L1D RAM/Cache
  - 256KB of L2 Unified Mapped RAM/Caches With ECC
- System Memory Management Unit (MMU)
  - Maps C674x DSP and EDMA TC Memory Accesses to System Addresses
- 128KB of On-Chip Memory Controller (OCMC) RAM
- Imaging Subsystem (ISS)
  - Camera Sensor Connection
    - Parallel Connection for Raw (up to 16-Bit) and BT.656 or BT.1120 (8- and 16-Bit)
  - Image Sensor Interface (ISIF) for Handling Image and Video Data From the Camera Sensor
  - Resizer
    - Resizing Image and Video From 1/16x to 8x
    - Generating Two Different Resizing Outputs Concurrently
- Programmable High-Definition Video Image Coprocessing (HDVICP v2) Engine
  - Encode, Decode, Transcode Operations
  - H.264, MPEG-2, VC-1, MPEG-4, SP/ASP, JPEG/MJPEG
- Media Controller
  - Controls the HDVPSS, HDVICP2, and ISS
- SGX530 3D Graphics Engine
  - Delivers up to 25 MPoly/sec
  - Universal Scalable Shader Engine
  - Direct3D Mobile, OpenGLES 1.1 and 2.0, OpenVG 1.0, OpenMax API Support
  - Advanced Geometry DMA Driven Operation
  - Programmable HQ Image Anti-Aliasing
- Endianness
  - ARM and DSP Instructions/Data – Little Endian
- HD Video Processing Subsystem (HDVPSS)
  - Two 165-MHz, 2-channel HD Video Capture Modules
    - One 16-/24-Bit Input or Dual 8-Bit SD Input Channels

- One 8-/16-/24-Bit Input and One 8-Bit Only Input Channels
- Two 165-MHz HD Video Display Outputs
  - One 16-, 24-, or 30-Bit Output and One 16- or 24-Bit Output
- Composite or S-Video Analog Output
- Macrovision® Support Available
- Digital HDMI 1.3 Transmitter With Integrated PHY
- Advanced Video Processing Features Such as Scan, Format, Rate Conversion
- Three Graphics Layers and Compositors

- Dual 32-Bit DDR2/DDR3 SDRAM Interfaces
  - Supports up to DDR2-800 and DDR3-1066
  - Up to Eight x 8 Devices Total 2GB of Total Address Space
  - Dynamic Memory Manager (DMM)
    - Programmable Multi-Zone Memory Mapping and Interleaving
    - Enables Efficient 2D Block Accesses
    - Supports Tiled Objects in 0°, 90°, 180°, or 270° Orientation and Mirroring
    - Optimizes Interlaced Accesses
- General-Purpose Memory Controller (GPMC)
  - 8- or 16-Bit Multiplexed Address and Data Bus
  - 512MB of Address Space Divided Among up to 8 Chip Selects
  - Glueless Interface to NOR Flash, NAND Flash (BCH/Hamming Error Code Detection), SRAM and Pseudo-SRAM
  - Error Locator Module (ELM) Outside of GPMC to Provide Up to 16-Bit or 512-Byte Hardware ECC for NAND
  - Flexible Asynchronous Protocol Control for Interface to FPGA, CPLD, ASICs, and so Forth
- Enhanced Direct Memory Access (EDMA) Controller
  - Four Transfer Controllers
  - 64 Independent DMA Channels and 8 Independent QDMA Channels
- Dual Port Ethernet (10/100/1000 Mbps) With Optional Switch
  - IEEE 802.3 Compliant (3.3-V I/O Only)
  - MII/RMII/GMII/RGMII Media Independent Interfaces
  - Management Data I/O (MDIO) Module
  - Reset Isolation
  - IEEE 1588 Time-Stamping and Industrial Ethernet Protocols
- Dual USB 2.0 Ports With Integrated PHYs
  - USB2.0 High- and Full-Speed Clients
  - USB2.0 High-, Full-, and Low-Speed Hosts, or OTG
  - Supports End Points 0–15
- One PCI Express 2.0 Port With Integrated PHY
  - Single Port With One Lane at 5.0 GT/s
  - Configurable as Root Complex or Endpoint
- Eight 32-Bit General-Purpose Timers (Timer1–8)
- One System Watchdog Timer (WDT0)
- Six Configurable UART/IrDA/CIR Modules
  - UART0 With Modem Control Signals
  - Supports up to 3.6864 Mbps UART0/1/2
  - Supports up to 12 Mbps UART3/4/5
  - SIR, MIR, FIR (4.0 MBAUD), and CIR
- Four Serial Peripheral Interfaces (SPIs) (up to 48 MHz)
  - Each With Four Chip Selects
- Three MMC/SD/SDIO Serial Interfaces (up to 48 MHz)
  - Three Supporting up to 1-, 4-, or 8-Bit Modes
- Dual Controller Area Network (DCAN) Modules
  - CAN Version 2 Part A, B
- Four Inter-Integrated Circuit (I^2C Bus) Ports
- Six Multichannel Audio Serial Ports (McASPs)
  - Dual Ten Serializer Transmit and Receive Ports
  - Quad Four Serializer Transmit and Receive Ports
  - DIT-Capable For S/PDIF (All Ports)
- Multichannel Buffered Serial Port (McBSP)
  - Transmit and Receive Clocks up to 48 MHz
  - Two Clock Zones and Two Serial Data Pins
  - Supports TDM, I2S, and Similar Formats
- Serial ATA (SATA) 3.0 Gbps Controller With Integrated PHY
  - Direct Interface to One Hard Disk Drive
  - Hardware-Assisted Native Command Queuing (NCQ) from up to 32 Entries
  - Supports Port Multiplier and Command-Based Switching
- Real-Time Clock (RTC)
  - One-Time or Periodic Interrupt Generation
- Up to 128 General-Purpose I/O (GPIO) Pins
- One Spin Lock Module with up to 128 Hardware Semaphores
- One Mailbox Module with 12 Mailboxes
- On-Chip ARM ROM Bootloader (RBL)
- Power, Reset, and Clock Management
  - Multiple Independent Core Power Domains
  - Multiple Independent Core Voltage Domains
  - Support for Three Operating Points (OPP100, OPP120, OPP166) per Voltage Domain
  - Clock Enable and Disable Control for Subsystems and Peripherals

- **32KB of Embedded Trace Buffer (ETB) and 5-Pin Trace Interface for Debug**
- **IEEE 1149.1 (JTAG) Compatible**
- **684-Pin Pb-Free BGA Package (CYE Suffix), 0.8-mm Ball Pitch With Via Channel**

1.2 Applications

- **HD Video Conferencing - Skype® Endpoints**
- **Video Surveillance DVRs, IP Netcam**
- **Digital Signage**
- **Media Players and Adapters**
- **Mobile Medical Imaging**
- **Network Projectors**
- **Home Audio and Video Equipment**

Technology to Reduce PCB Cost

- **45-nm CMOS Technology**
- **1.8- and 3.3-V Dual Voltage Buffers for General I/O**

1.3 Description

TMS320DM814x DaVinci video processors are highly integrated, programmable platforms that leverage the DaVinci processor technology to meet the processing needs of the following applications to name a few:

- HD Video Conferencing - Skype endpoints
- Video Surveillance DVRs
- IP Netcam
- Digital Signage
- Media Players and Adapters
- Mobile Medical Imaging
- Network Projectors
- Home Audio and Video Equipment

The device enables Original-Equipment Manufacturers (OEMs) and Original-Design Manufacturers (ODMs) to quickly bring to market devices featuring robust operating systems support, rich user interfaces, and high processing performance through the maximum flexibility of a fully integrated mixed processor solution. The device also combines programmable video and audio processing with a highly integrated peripheral set.

The TMS320DM814x DaVinci video processors also present OEMs and ODMs with new levels of processor scalability and software reuse. An OEM or ODM that used the AM387x processors in a design and can make a similar product with added features could scale up to the pin-compatible and software-compatible TMS320DM814x processors from TI. The TMS320DM814x DaVinci video processors add a powerful C674x DSP core along with a video encoder and decoder to the hardware on the AM38x. Additionally, OEMs or ODMs that have used the AM387x or DM814x processors and find a need for a faster ARM and DSP core performance could scale up to the software-compatible AM389x or TMS320DM816x devices with higher core speeds.

Programmability is provided by an ARM Cortex-A8 RISC CPU with Neon extension, TI C674x VLIW floating-point DSP core, and high-definition video and imaging coprocessors. The ARM lets developers keep control functions separate from A/V algorithms programmed on the DSP and coprocessors, thus reducing the complexity of the system software. The ARM Cortex-A8 32-Bit RISC Core with Neon floating-point extension includes: 32KB of Instruction cache; 32KB of Data cache; 512KB of L2 Cache; 48KB of Boot ROM; and 64KB of RAM.

The rich peripheral set provides the ability to control external peripheral devices and communicate with external processors. For details on each of the peripherals, see the related sections in this document and the associated peripheral reference guides. The peripheral set includes:

- HD Video Processing Subsystem
- Dual Port Gigabit Ethernet MACs (10/100/1000 Mbps) [Ethernet Switch] with MII/RMII/GMII/RGMII and MDIO interface supporting IEEE 1588 Time-Stamping and Industrial Ethernet Protocols
- Two USB ports with integrated 2.0 PHY
- PCIe x1 GEN2 Compliant interface
- Two 10-serializer McASP audio serial ports (with DIT mode)
- Four quad-serilaizer McASP audio serial ports (with DIT mode)
- One McBSP multichannel buffered serial port
- Six UARTs with IrDA and CIR support
- Four SPI serial interfaces
- Three MMC/SD/SDIO serial interfaces
- Four I^2C master and slave interfaces
- Parallel Camera Interface (CAM)
- Up to 128 General-Purpose I/Os (GPIOs)

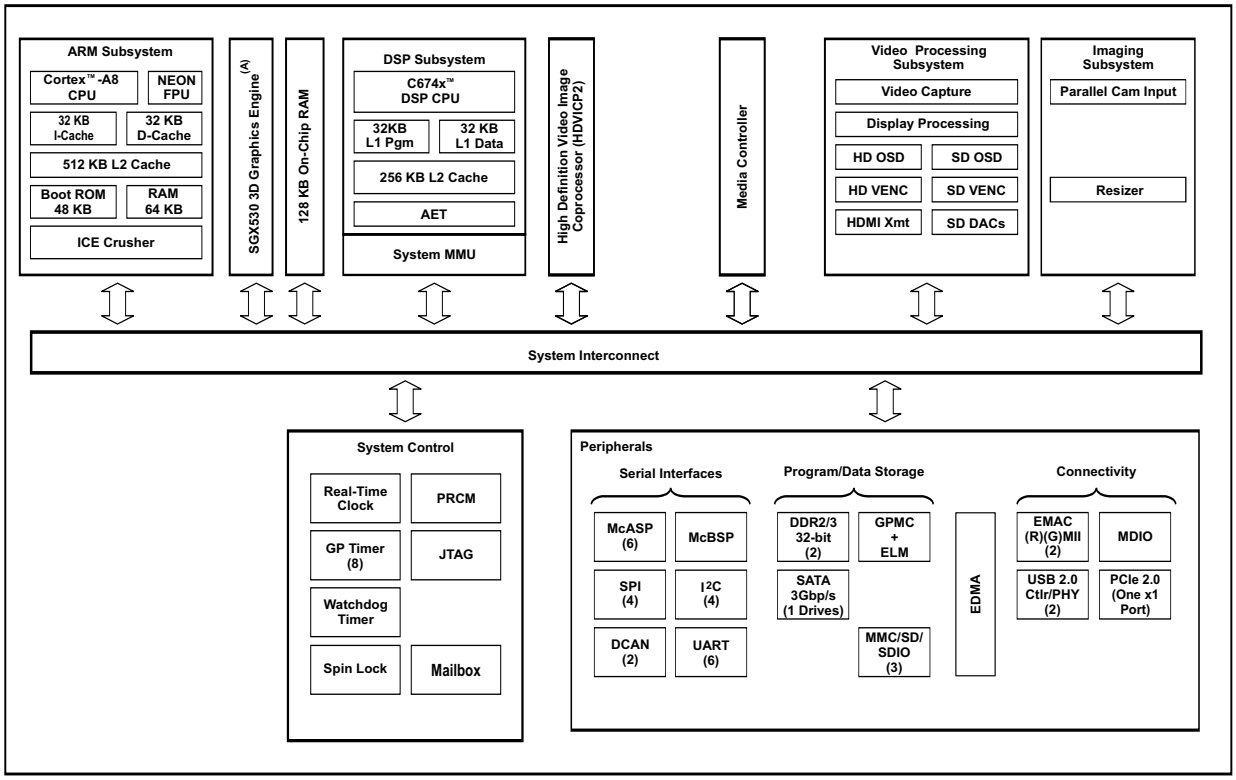
- Eight 32-bit general-purpose timers
- System watchdog timer
- Dual DDR2, and DDR3 SDRAM interfaces
- Flexible 8- or 16-bit asynchronous memory interface
- Two Controller Area Network (DCAN) modules
- Spin Lock
- Mailbox
- Serial Hard Disk Drive Interface (SATA 300)

The TMS320DM814x DaVinci video processors also include a high-definition video and imaging coprocessor 2 (HDVICP2), and an SGX530 3D graphics engine to off-load many video and imaging processing tasks from the DSP core, making more DSP MIPS available for common video and imaging algorithms. Additionally, it has a complete set of development tools for both the ARM and DSP, which include C compilers, a DSP assembly optimizer to simplify programming and scheduling, and a Microsoft® Windows® debugger interface for visibility into source code execution.

The C674x DSP core is the high-performance floating-point DSP generation in the TMS320C6000 DSP platform and is code-compatible with previous generation C64x Fixed-Point and C67x Floating-Point DSP generation. The C674x Floating-Point DSP processor uses 32KB of L1 program memory with EDC and 32KB of L1 data memory. Up to 32KB of L1P can be configured as program cache. The remaining memory is noncacheable no-wait-state program memory. Up to 32KB of L1D can be configured as data cache. The remaining memory is noncacheable no-wait-state data memory. The DSP has 256KB of L2 RAM with ECC, which can be defined as SRAM, L2 cache, or a combination of both. All C674x L3 and off-chip memory accesses are routed through an MMU.

1.4 Functional Block Diagram

Figure 1-1 shows the functional block diagram of the device.



A. SGX530 is only available on the DM8148 device.

Figure 1-1. TMS320DM814x DaVinci video Processors Functional Block Diagram

Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

This data manual revision history highlights the technical changes made to the SPRS647D device-specific data manual to make it an SPRS647E revision.

Scope: Applicable updates to the DM814x DaVinci™ Video DMP device family, specifically relating to the TMS320DM8148/47 devices (Silicon Revisions 3.0, 2.1), which are now in the production data (PD) stage of development have been incorporated.

- Updated/Changed Power-Up Sequence
- Updated/Changed Power-Down Sequence
- Low-end OPP combinations no longer supported (CVDD_x < CVDD)
- Added RXACTIVE Function (Bit 18) to PINCTRLx Register Description
- Added Power-On Hours (POH) section
- Added Latch-Up Performance Absolute Maximum Ratings
- DDR2/DDR3 supports up to 533 MHz
- OPP50 is **not** supported
- SmartReflex™ (AVS) is **not** supported
- Deep Sleep Mode is **not** supported
- HDMI HDCP encryption is **not** supported

SEE	ADDITIONS/MODIFICATIONS/DELETIONS
Global	• Replaced all instances of "DSP/EDMA MMU" with "**System MMU**" • Deleted all references to OPP50 and Deep Sleep Mode • Deleted the TMS320DM8146 device along with any device-specific information; no longer supported
Section 1 Features	• Updated/Changed description the HD Video Processing Subsystem (HDVPSS) • Updated/Changed the Dual 32-Bit DDR2/DDR3 SDRAM Interfaces sub-bullet from "Supports up to DDR2-800 and DDR3-**800**" to "Supports up to DDR2-800 and DDR3-**1066**"
Section 2.2 Device Characteristics	Table 2-2, Characteristics of the Processor: • Updated/Changed the HD Video Processing Subsystem (HDVPSS) row • Updated/Changed Core Logic (V), OPP100, OPP120 range from "0.95 V – 1.20 V" to "1.10 V – 1.20 V"
Section 2.12.4.2 L4 Slow Peripheral Memory Map	Table 2-7, L4 Slow Peripheral Memory Map: • Updated/Changed 0x4818_8000–0x4818_BFFF Device Name from "SmartReflex0/1 Peripheral and Support Registers" to **"Reserved"** • Updated/Changed 0x4819_0000–0x4819_3FFF Device Name from "SmartReflex2/3 Peripheral and Support Registers" to **"Reserved"**
Section 3.2.7 General-Purpose Input/Outputs (GPIOs)	Table 3-11, GP1 Terminal Functions: • Added "The ENLVCMOS bit in the MLBP_DAT_IO_CTRL register...." to the pin descriptions for pins GP1[10:7] (V2, V1, W2, and W1 respectively).
Section 3.2.25 Reserved Pins	Table 3-48, Reserved Terminal Functions: • Updated/Changed TYPE for Signal No. Y14 (RSV4) and AC8 (RSV5) from "S" to **"I"**

SEE	ADDITIONS/MODIFICATIONS/DELETIONS
Section 4 Device Configurations	Section 4.3, Pin Multiplexing Control: • Updated/Changed bit 18 from "RSV" to "RXACTIVE"
	Table 4-11, PINCNTL1 – PINCNTL270 (PINCNTLx) Registers Bit Descriptions: • Updated/Changed the MUXMODE[7:0] Description from "Values other than those ..." to **"A value of zero results ..."** • Updated/Changed bit 18 description to now support RXACTIVE
	Table 4-13, PINCNTLx Registers MUXMODE Functions: • Updated/Changed PINCNTL173 row under 0x20 from "UART2_TXD(M1)" to **"UART2_TXD(M0)"** • Updated/Changed PINCNTL231 under 0x80 from "GP3[30](M0)" to **"GP3[30](M1)"**
	Section 4.4, Handling Unused Pins: • Added "Unless otherwise noted" to the beginning of, "All supply pins must always ..."
Section 6 Device Operating Conditions	Section 6.1, Absolute Maximum Ratings: • Deleted the "V I/O...(Transient Overshoot/Undershoot)" rows of Input and Output voltage ranges • Added Latch-Up Performance row and Latch-Up footnotes • Updated/Changed ESD-HBM footnote to "Level listed is passing level per ANSI/ESDA/JEDEC J5-001..." • Updated/Changed ESD-CDM footnote to "Level listed is passing level per EIA-JEDEC JESD22-C101E..."
	Section 6.3, Power on Hours (POH): • Added Power-On Hour (POH) section **[New]**
Section 7.2.2.1 Dynamic Voltage Frequency Scaling (DVFS)	Table 7-5, Supported OPP Combinations: • Deleted lower-end OPP combinations supported for ARM, DSP, and HDVICP2
Section 7.2.8.1 Power-Up Sequence	Table 7-6 , Power-Up Sequence Ramping Values: • Added NO. 1 MIN value of "0" ms. • Updated/Changed NO. 1 description to "1.8 V and DVDD_DDR[x] supplies stable..." • Added NO. 13, "CVDD variable supply ramp...." • Updated/Changed Figure 7-1 according to table changes • Deleted 3.3 V Supplies Rising Before 1.8 V Supplies Delta Figure (was Figure 7.2) and associated footnote references • Deleted footnote, "The 3.3 V supplies must be..."
Section 7.2.8.2 Power-Down Sequence	Section 7.2.8.2, Power-Down Sequence: • Added, "Ramping down all supplies at the same time...For proper device..." paragraph
	Table 7-7, Power-Down Sequence Ramping Values: • Updated/Changed "The 1.5-/1.8-V DVDD_DDR[x]..." footnote • Updated/Changed figure reference to Figure 7-3 • Added NO. 14, "CVDD_x variable supplies ramp-down..." • Added associated footnote, "CVDD_x must never exceed CVDD by more than 150mV"
	Figure 7-2, Power-Down Sequence: • Updated/Changed figure according to table changes
	Figure 7-3,1.8 V Supplies Falling Before 3.3 V Supplies Delta: • Added figure **[New]**

SEE	ADDITIONS/MODIFICATIONS/DELETIONS
Section 7.4 Clocking	Section 7.4.1.1, Using the Internal Oscillators: Table 7-11, Requirements for Crystal Circuit on the Device Oscillator (DEVOSC): • Added three conditions and the MAX values to the Crystal Frequency Stability PARAMETER
	Table 7-15, Timing Requirements for DEVOSC_MXI/DEV_CLKIN • Added three conditions and the MAX values to the Frequency Stability PARAMETER
	Section 7.4.3, AUD_CLKINx Input Clocks: • Added section **[New]**
	Section 7.4.4, CLKIN32 Input Clock: • Added "/8" to the TIMER1/2/3/4/5/6/7 bullet
	Section 7.4.7, Input/Output Clocks Electrical Data/Timing: • Added Table 7-17, Timing Requirements for AUD_CLKINx **[New]** • Added Figure 7-14, AUD_CLKINx Timing **[New]**
	Section 7.4.8, PLLs: • Deleted PLL Electrical Data/Timing subsection
Section 7.4.9 SYSCLKs	Table 7-26, Maximum SYSCLK Clock Frequencies: • Added footnote, "The maximum frequencies listed..."
Section 7.4.10 Module Clocks	Table 7-27, Maximum Module Clock Frequencies: • Updated/Changed Media Controller **CLOCK SOURCES** from "PLL_MEDIACTL" to "PLL_MEDIACTL/2" • Updated/Changed Media Controller **MAX FREQUENCY OPP100 (MHz)** value from "400" to "200" • Added footnote, "The maximum frequencies listed..."
Section 8.4 EDMA	Section 8.4.1, EDMA Channel Synchronization Events: • Updated/Changed paragraphs
	Section 8.4.2, EDMA Peripheral Register Descriptions: • Added Table 8-5, EDMA Channel Controller (EDMA TPCC) Control Registers • Added Table 8-6, EDMA Transfer Controller (EDMA TPTC) Control Registers
Section 8.5.3 IEEE 1149.1 JTAG	Table 8-8, JTAG ID Register Table: • Added silicon-revision specific information to the VARIANT bit field
Section 8.6.2.3 EMAC RGMII Electrical Data/Timing	• Updated/Changed all instances of "at DSP" to "at device"
Section 8.10.1 HDVPSS Electrical Data/Timing	Table 8-42, Timing Requirements for HDVPSS Input: • Deleted NO. 7, $t_{t(CLK)}$, Transition time, VIN[x]A_CLK (10%-90%) • Deleted NO. 7, $t_{t(CLK)}$, Transition time, VIN[x]B_CLK (10%-90%)
Section 8.13.4, DDR2/DDR3 Memory Controller Electrical Data/Timing	Table 8-53, Switching Characteristics Over Recommended Operating Conditions for DDR2/DDR3 Memory Controller: • Updated/Changed NO. 1, $t_{c(DDR\_CLK)}$, Cycle time, DDR[x]_CLK, **DDR2/DDR3 mode** to **DDR2 mode** • Added additional row to NO.1, $t_{c(DDR\_CLK)}$, Cycle time, DDR[x]_CLK: **DDR3 mode**
Section 8.13.4.1 DDR2 Routing Specifications	Section 8.13.4.1.1.1, DDR2 Interface Schematic: • Updated/Changed the sentence from, "... pins by pulling the non-inverted DQS pin..." to **"... DDR[x]_DQS[n] pins to the corresponding..."** • Updated/Changed a sentence from, "... inverted DQS pin..." to "... **$\overline{\text{DDR[x]\_DQS[n]}}$ pins...**" • Added sentence, "The DVDD_DDR[x] and VREFSSTL_DDR[x] power..."
Section 8.13.4.1.2 DDR2 CK and ADDR_CTRL Routing	Table 8-63, CK and ADDR_CTRL Routing Specification: • Updated/Changed the "Series terminator,...the DSP" footnote to "Series terminator,..the processor"
Section 8.13.4.2 DDR3 Routing Specifications	Section 8.13.4.2.4, DDR3 Interface Schematic: • Combined 16-Bit and 32-Bit DDR3 Interface subsections • Deleted repeated figure references • Deleted the sentence, "and the unused DQS.....pulled to ground via 1-kΩ resistors." • Added sentence, "The DVDD_DDR[x] and VREFSSTL_DDR[x]..."

SEE	ADDITIONS/MODIFICATIONS/DELETIONS
Section 8.13.4.2.4.1 Compatible JEDEC DDR3 Devices	Table 8-66, Compatible JEDEC DDR3 Devices (Per Interface): • Updated/Changed the max clock rate in footnote, "DDR3 devices with speed...." from "400" MHz to "533" MHz
Section 8.14.3 McASP (McASP[5:0]) Electrical Data/Timing	Table 8-78, Timing Requirements for McASP: • Updated/Changed **McASP1 Only** ACLKR/X ext out, MIN value for NO. 5, $t_{su(AFSRX-ACLKRX)}$, Setup time, MCA[x]_AFSR/X input valid before MCA[X]_ACLKR/X from "4" to **"2"** ns. • Updated/Changed **McASP1 Only** ACLKR/X ext out, MIN value for NO. 7,$t_{su(AXR-ACLKRX)}$, Setup time, MCA[x]_AXR input valid before MCA[X]_ACLKR/X from "4" to **"2"** ns.
Section 8.15 Multichannel Buffered Serial Port (McBSP)	Table 8-80, McBSP Registers: • Updated/Changed McBSP HEX ADDRESS range from "0x4700 0000 - 0x4700 00C0" to **"0x4700 0100 – 0x4700 01C0"** (DDR_REG to STATUS_REG) • Added McBSP registers in HEX ADDRESS range **"0x4700 0000 – 0x4700 004C"** (REVNB to DMATXWAKE_EN)
Section 9.1.2 Device and Development-Support Tool Nomenclature	Figure 9-1, Device Nomenclature: • Added "D = -40ºC to 90ºC, Industrial Temperature" to the TEMPERATURE RANGE area

2 Device Overview

2.1 Device Comparison

Table 2-1 shows a comparison between devices, highlighting the differences.

Table 2-1. DM814x Device Comparison

FEATURES	DEVICES	
	TMS320DM8148	TMS320DM8147
SGX530	YES (1)	NONE

2.2 Device Characteristics

Table 2-2 provides an overview of the TMS320DM814x DaVinci™ Digital Media Processors, which includes significant features of the device, including the capacity of on-chip RAM, peripherals, and the package type with pin count.

Table 2-2. Characteristics of the Processor

HARDWARE FEATURES		DM814x
Peripherals Not all peripherals pins are available at the same time (for more details, see the Device Configurations section).	HD Video Processing Subsystem (HDVPSS)	1 16-/24-bit HD Capture Port **or** 2 8-bit SD Capture Ports **and** 1 8-bit SD Capture Port **and** 1 16-/24-/30-bit HD Display Port **or** 1 8-/16-/24-bit HD Capture Port **and** 1 16-24-bit HD Display Port **and** 1 HDMI 1.3 Transmitter **and** 2 SD Video DACs
	Imaging Subsystem (ISS)	1 Parallel Camera Input for Raw (up to 16-bit) and BT.656/BT.1120 (8/16-bit)
	DDR2/3 Memory Controller	2 (32-bit Bus Widths)
	GPMC + ELM	Asynchronous (8-/16-bit bus width) RAM, NOR, NAND
	EDMA	64 Independent Channels 8 QDMA Channels
	10/100/1000 Ethernet MAC Switch with Management Data Input/Output (MDIO)	1 (with 2 MII/RMII/GMII/RGMII Interfaces)
	USB 2.0	2 (Supports High- and Full-Speed as a Device and High-, Full-, and Low-Speed as a Host, or OTG)
	PCI Express 2.0	1 Port (1 5.0GT/s lane)
	Timers	8 (32-bit General purpose) ***and*** 1 (System Watchdog)
	UART	6 (with SIR, MIR, FIR, CIR support and RTS/CTS flow control) (UART0 Supports Modem Interface)
	SPI	4 (Supports 4 slave devices)
	MMC/SD/SDIO	1 (1-bit or 4-bit or 8-bit modes) ***and*** 1 (8-bit mode) ***or*** 2 (1-bit or 4-bit modes)

Table 2-2. Characteristics of the Processor (continued)

HARDWARE FEATURES			DM814x
	I2C		4 (Master/Slave)
	Media Controller		Controls HDVPSS, HDVICP2, and ISS
	McASP		6 (10/10/4/4/4/4 Serializers, Each with Transmit/Receive and DIT capability)
	McBSP		1 (2 Data Pins, Transmit/Receive)
	Controller Area Network (DCAN)		2
	Serial ATA (SATA) 3.0 Gbps		1 (Supports 1 Hard Disk Drive)
	RTC		1
	GPIO		Up to 128 pins
	Parallel Camera Interface (CAM)		1
	Spin Lock Module		1 (up to 128 H/W Semaphores)
	Mailbox Module		1 (with 12 Mailboxes)
On-Chip Memory	Size (Bytes)		1088KB RAM, 48KB ROM
	Organization		**ARM** 32KB I-cache 32KB D-cache 512KB L2 Cache 64KB RAM 48KB Boot ROM
			DSP 32KB L1 Program (L1P)/Cache (up to 32KB) with EDC 32KB L1 Data (L1D)/Cache (up to 32KB) 256KB Unified Mapped RAM/Cache (L2) with ECC
			ADDITIONAL SHARED MEMORY 128KB On-chip RAM

		OPP166	1.35 V
	I/O (V)		1.5 V, 1.8 V, 3.3 V
Package	23 x 23 mm [Flip Chip Ball Grid Array (FCBGA)]		684-Pin BGA (CYE) [with Via Channel Technology]
Process Technology	µm		0.045 µm
Product Status(1)	Product Preview (PP), Advance Information (AI), or Production Data (PD)		PD

(1) PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

2.3 Device Compatibility

2.4 ARM® Cortex™-A8 Microprocessor Unit (MPU) Subsystem Overview

The ARM® Cortex™-A8 Subsystem is designed to give the ARM Cortex-A8 Master control of the device. In general, the ARM Cortex-A8 is responsible for configuration and control of the various subsystems, peripherals, and external memories.

The ARM Cortex-A8 Subsystem includes the following features:

- ARM Cortex-A8 RISC processor:
  - ARMv7 ISA plus Thumb2™, JazelleX™, and Media Extensions
  - Neon™ Floating-Point Unit
  - Enhanced Memory Management Unit (MMU)
  - Little Endian
  - 32KB L1 Instruction Cache
  - 32KB L1 Data Cache
  - 512KB L2 Cache
- CoreSight Embedded Trace Module (ETM)
- ARM Cortex-A8 Interrupt Controller (AINTC)
- Embedded PLL Controller (PLL_ARM)
- 64KB Internal RAM
- 48KB Internal Public ROM

Figure 2-1 shows the ARM Cortex-A8 Subsystem for the device.

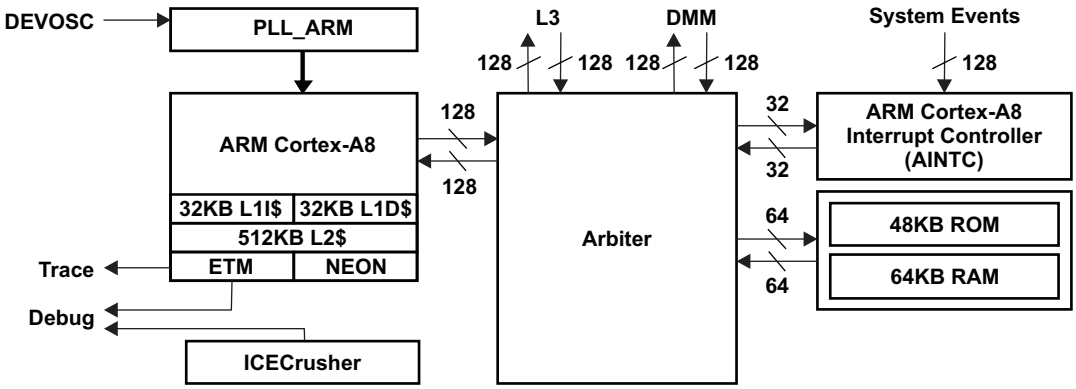

Figure 2-1. ARM Cortex-A8 Subsystem

For more details on the ARM Cortex-A8 Subsystem, see the System MMU section of the *Chip Level Resources* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

2.4.1 ARM Cortex-A8 RISC Processor

The ARM Cortex-A8 Subsystem integrates the ARM Cortex-A8 processor. The ARM Cortex-A8 processor is a member of ARM Cortex family of general-purpose microprocessors. This processor is targeted at multi-tasking applications where full memory management, high performance, low die size, and low power are all important. The ARM Cortex-A8 processor supports the ARM debug architecture and includes logic to assist in both hardware and software debug. The ARM Cortex-A8 processor has a Harvard architecture and provides a complete high-performance subsystem, including:

- ARM Cortex-A8 Integer Core
- Superscalar ARMv7 Instruction Set

- Thumb-2 Instruction Set
- Jazelle RCT Acceleration
- CP14 Debug Coprocessor
- CP15 System Control Coprocessor
- NEON™ 64-/128-bit Hybrid SIMD Engine for Multimedia
- Enhanced VFPv3 Floating-Point Coprocessor
- Enhanced Memory Management Unit (MMU)
- Separate Level-1 Instruction and Data Caches
- Integrated Level-2 Cache
- 128-bit Interconnector-to-System Memories and Peripherals
- Embedded Trace Module (ETM).

2.4.2 Embedded Trace Module (ETM)

To support real-time trace, the ARM Cortex-A8 processor provides an interface to enable connection of an embedded trace module (ETM). The ETM consists of two parts:

- The Trace port which provides real-time trace capability for the ARM Cortex-A8.
- Triggering facilities that provide trigger resources, which include address and data comparators, counter, and sequencers.

The ARM Cortex-A8 trace port is not pinned out and is, instead, only connected to the system-level Embedded Trace Buffer (ETB). The ETB has a 32KB buffer memory. ETB enabled debug tools are required to read/interpret the captured trace data.

For more details on the ETM, see Section 8.5.2, *Trace*.

2.4.3 ARM Cortex-A8 Interrupt Controller (AINTC)

The ARM Cortex-A8 subsystem contains an interrupt controller (AINTC) that prioritizes all service requests from the system peripherals and generates either IRQ or FIQ to the ARM Cortex-A8 processor. For more details on the AINTC, see Section 7.5.1, *ARM Cortex-A8 Interrupts*.

Note: For General-Purpose devices, the AINTC does not support the generation of FIQs to the ARM processor.

2.4.4 ARM Cortex-A8 PLL (PLL_ARM)

The ARM Cortex-A8 subsystem contains an embedded PLL Controller (PLL_ARM) for generating the subsystem's clocks from the DEV Clock input. For more details on the PLL_ARM, see Section 7.4, *Clocking*.

2.4.5 ARM MPU Interconnect

The ARM Cortex-A8 processor is connected through the arbiter to both an L3 interconnect port and a DMM port. The DMM port is 128 bits wide and provides the ARM Cortex-A8 direct access to the DDR memories, while the L3 interconnect port is 64 bits wide and provides access to the remaining device modules.

2.5 C674x™ DSP Overview

The DSP Subsystem includes the following features:

- C674x DSP CPU
- 32KB L1 Program (L1P)/Cache (up to 32KB) with Error Detection Circuitry (EDC)
- 32KB L1 Data (L1D)/Cache (up to 32KB)
- 256KB Unified Mapped RAM/Cache (L2) with Error Correction Circuitry (ECC)
- Direct Connection to the HDVICP2 Host SL2 Port
- Little Endian

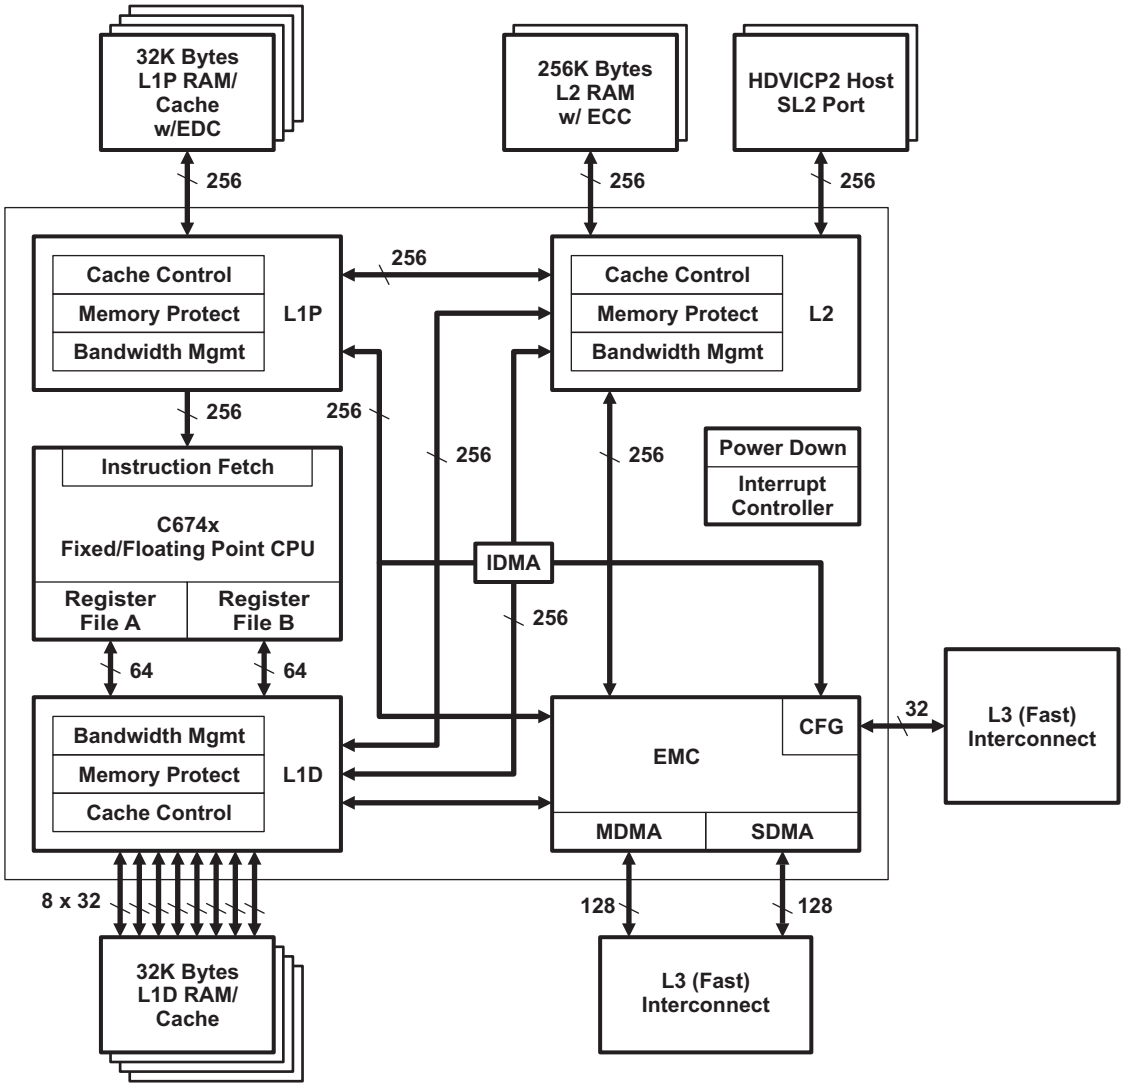

Figure 2-2. C674x Megamodule Block Diagram

2.5.1 C674x DSP CPU Description

The C674x central processing unit (CPU) consists of eight functional units, two register files, and two data paths as shown in Figure 2-2. The two general-purpose register files (A and B) each contain 32 32-bit registers for a total of 64 registers. The general-purpose registers can be used for data or can be data address pointers. The data types supported include packed 8-bit data, packed 16-bit data, 32-bit data, 40-bit data, and 64-bit data. Values larger than 32 bits, such as 40-bit-long or 64-bit-long values are stored in register pairs, with the 32 LSBs of data placed in an even register and the remaining 8 or 32 MSBs in the next upper register (which is always an odd-numbered register).

The eight functional units (.M1, .L1, .D1, .S1, .M2, .L2, .D2, and .S2) are each capable of executing one instruction every clock cycle. The .M functional units perform all multiply operations. The .S and .L units perform a general set of arithmetic, logical, and branch functions. The .D units primarily load data from memory to the register file and store results from the register file into memory.

The C674x CPU combines the performance of the C64x+ core with the floating-point capabilities of the C67x+ core.

Each C674x .M unit can perform one of the following each clock cycle: one 32 x 32 bit multiply, one 16 x 32 bit multiply, two 16 x 16 bit multiplies, two 16 x 32 bit multiplies, two 16 x 16 bit multiplies with add/subtract capabilities, four 8 x 8 bit multiplies, four 8 x 8 bit multiplies with add operations, and four 16 x 16 multiplies with add/subtract capabilities (including a complex multiply). There is also support for Galois field multiplication for 8-bit and 32-bit data. Many communications algorithms such as FFTs and modems require complex multiplication. The complex multiply (CMPY) instruction takes four 16-bit inputs and produces a 32-bit real and a 32-bit imaginary output. There are also complex multiplies with rounding capability that produces one 32-bit packed output that contain 16-bit real and 16-bit imaginary values. The 32 x 32 bit multiply instructions provide the extended precision necessary for high-precision algorithms on a variety of signed and unsigned 32-bit data types.

The .L or (Arithmetic Logic Unit) now incorporates the ability to do parallel add/subtract operations on a pair of common inputs. Versions of this instruction exist to work on 32-bit data or on pairs of 16-bit data performing dual 16-bit add and subtracts in parallel. There are also saturated forms of these instructions.

The C674x core enhances the .S unit in several ways. On the previous cores, dual 16-bit MIN2 and MAX2 comparisons were only available on the .L units. On the C674x core they are also available on the .S unit which increases the performance of algorithms that do searching and sorting. Finally, to increase data packing and unpacking throughput, the .S unit allows sustained high performance for the quad 8-bit/16-bit and dual 16-bit instructions. Unpack instructions prepare 8-bit data for parallel 16-bit operations. Pack instructions return parallel results to output precision including saturation support.

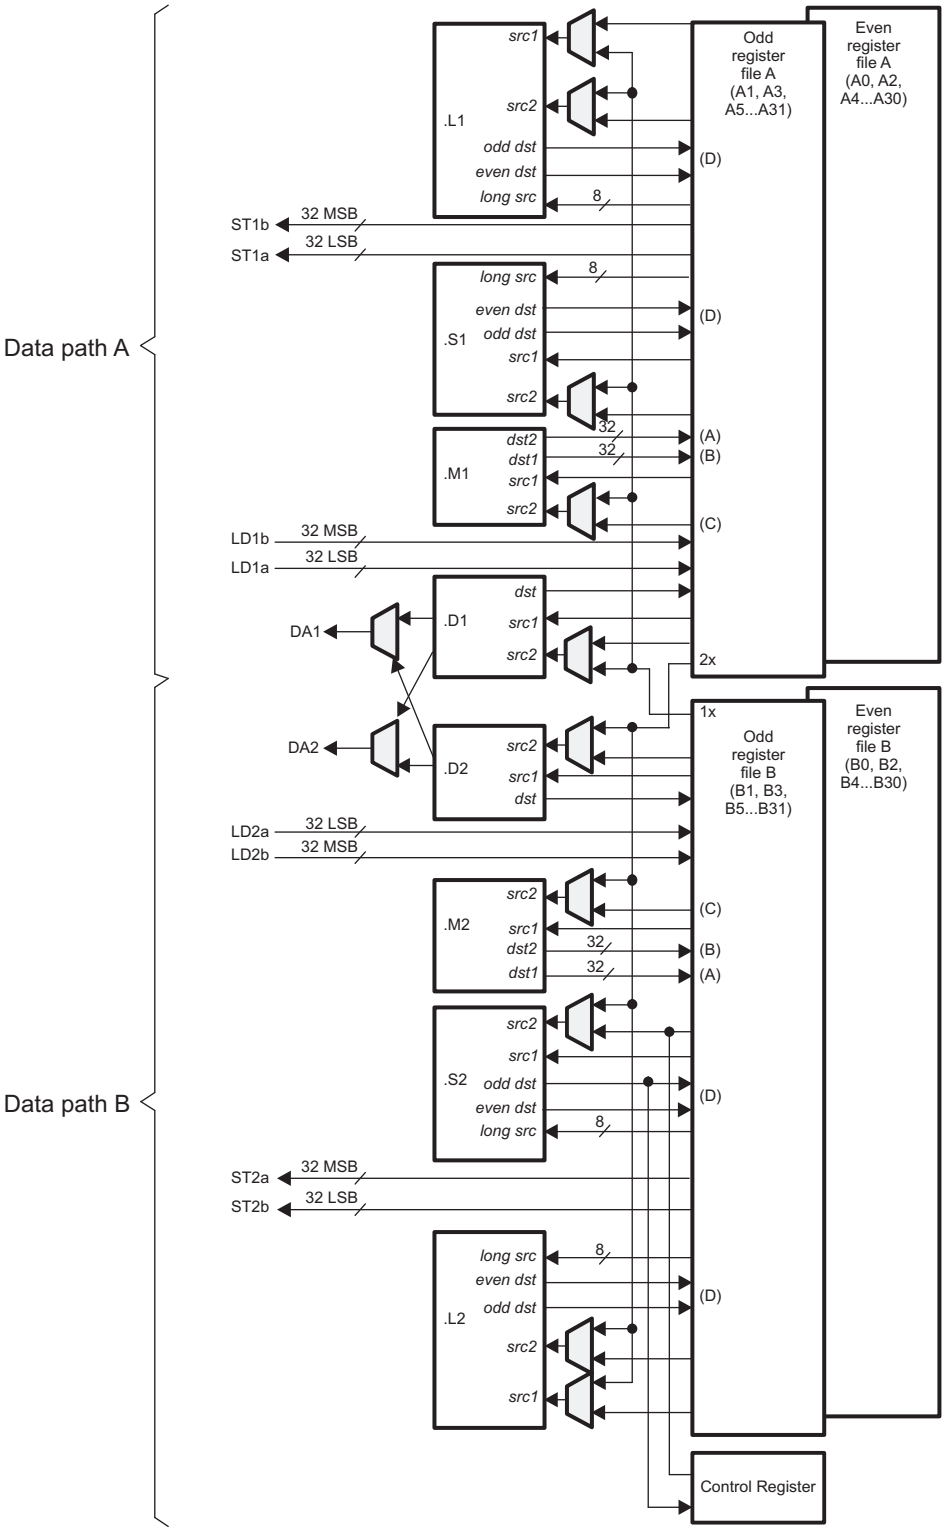
Other new features include:

- **SPLOOP** - A small instruction buffer in the CPU that aids in creation of software pipelining loops where multiple iterations of a loop are executed in parallel. The SPLOOP buffer reduces the code size associated with software pipelining. Furthermore, loops in the SPLOOP buffer are fully interruptible.
- **Compact Instructions** - The native instruction size for the C6000 devices is 32 bits. Many common instructions such as MPY, AND, OR, ADD, and SUB can be expressed as 16 bits if the C674x compiler can restrict the code to use certain registers in the register file. This compression is performed by the code generation tools.
- **Instruction Set Enhancement** - As noted above, there are new instructions such as 32-bit multiplications, complex multiplications, packing, sorting, bit manipulation, and 32-bit Galois field multiplication.
- **Exceptions Handling** - Intended to aid the programmer in isolating bugs. The C674x CPU is able to detect and respond to exceptions, both from internally detected sources (such as illegal op-codes) and from system events (such as a watchdog time expiration).
- **Privilege** - Defines user and supervisor modes of operation, allowing the operating system to give a basic level of protection to sensitive resources. Local memory is divided into multiple pages, each with read, write, and execute permissions.

- **Time-Stamp Counter** - Primarily targeted for Real-Time Operating System (RTOS) robustness, a free-running time-stamp counter is implemented in the CPU which is ***not*** sensitive to system stalls.

For more details on the C674x CPU and its enhancements over the C64x architecture, see the following documents:

- *TMS320C674x DSP CPU and Instruction Set Reference Guide* (Literature Number: SPRUFE8)
- *TMS320C674x DSP Megamodule Reference Guide* (Literature Number: SPRUFK5)



A. .M unit, *dst2* is 32 MSB.
B On .M unit, *dst1* is 32 LSB.
C. On C64x CPU .M unit, *src2* is 32 bits; on C64x+ CPU .M unit, *src2* is 64 bits.
D. On .L and .S units, *odd dst* connects to odd register files and even *dst* connects to even register files

Figure 2-3. TMS320C674x CPU (DSP Core) Data Paths

2.6 System Memory Management Unit (MMU)

All C674x accesses through its MDMA port will be directed through the system MMU module where they are remapped to physical system addresses. This protects the ARM Cortex-A8 memory regions from accidental corruption by C674x code and allows for direct allocation of buffers in user space without the need for translation between ARM and DSP applications.

In addition, accesses by the EDMA TC0 and TC1 may optionally be routed through the system MMU. This allows EDMA Channels 0 and 1 to be used by the DSP to perform transfers using only the known virtual addresses of the associated buffers. The MMU_CFG register in the Control Module is used to enable/disable use of the system MMU by the EDMA TCs.

For more details on the system MMU features, see the system MMU section of the *Chip Level Resources* chapter in the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

2.7 Media Controller Overview

The Media Controller has the responsibility of managing the HDVPSS, HDVICP2, and ISS modules.

For more details on the Media Controller, see the Media Controller Subsystem section of the *Chip Level Resources* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

2.8 HDVICP2 Overview

The HDVICP2 is a Video Encoder/Decoder hardware accelerator supporting a range of encode, decode, and transcode operations for most major video codec standards. The main video Codec standards supported in hardware are MPEG1/2/4 ASP/SP, H.264 BL/MP/HP, VC-1 SP/MP/AP, RV9/10, AVS-1.0, and ON2 VP6.2/VP7.

The HDVICP2 hardware accelerator is composed of the following elements:

- Motion estimation acceleration engine
- Loop filter acceleration engine
- Sequencer, including its memories and an interrupt controller
- Intra-prediction estimation engine
- Calculation engine
- Motion compensation engine
- Entropy coder/decoder
- Video Direct Memory Access (DMA)
- Synchronization boxes
- Shared L2 controller
- Local interconnect

For more details on the HDVICP2, see the HD Video Coprocessor SubSystem section of the *Chip Level Resources* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

2.9 SGX530 Overview

The SGX530 is a vector/3D graphics accelerator for vector and 3-dimensional (3D) graphics applications. The SGX530 graphics accelerator efficiently processes a number of various multimedia data types concurrently:

- Pixel data
- Vertex data
- Video data

This is achieved using a multi-threaded architecture using two levels of scheduling and data partitioning enabling zero overhead task switching.

The SGX530 has the following major features:

- Vector graphics and 3D graphics
- Tile-based architecture
- Universal Scalable Shader Engine (USSE™) - multi-threaded engine incorporating pixel and vertex shader functionality
- Advanced shader feature set - in excess of Microsoft VS3.0, PS3.0, and OpenGL2.0
- Industry standard API support - OpenGL ES 1.1 and 2.0, OpenVG v1.1
- Fine-grained task switching, load balancing, and power management
- Advanced geometry DMA driven operation for minimum CPU interaction
- Programmable high-quality image anti-aliasing
- POWERVR® SGX core MMU for address translation from the core virtual address to the external physical address (up to 4GB address range)
- Fully-virtualized memory addressing for OS operation in a unified memory architecture
- Advanced and standard 2D operations [for example, vector graphics, block level transfers (BLTs), raster operations (ROPs)]

For more details on the SGX530, see the *Chip Level Resources* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

2.10 Spinlock Module Overview

The Spinlock module provides hardware assistance for synchronizing the processes running on multiple processors in the device:

- ARM Cortex-A8 processor
- C674x DSP
- Media Controller

The Spinlock module implements 128 spinlocks (or hardware semaphores) that provide an efficient way to perform a lock operation of a device resource using a single read-access, avoiding the need for a read-modify-write bus transfer of which the programmable cores are not capable.

For more details on the Spinlock Module, see the Spinlock section of the *Chip Level Resources* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

2.11 Mailbox Module Overview

The device Mailbox module facilitates communication between the ARM Cortex-A8, C674x DSP, and the Media Controller. The device mailbox consists of twelve mailboxes, each supporting a 1-way communication between two of the above processors. The sender sends information to the receiver by writing a message to the mailbox registers. Interrupt signaling is used to notify the receiver that a message has been queued or to notify the sender about an overflow situation.

The Mailbox module supports the following features (see Figure 2-4):

- 12 mailboxes
- Flexible mailbox-to-processor assignment scheme
- Four-message FIFO depth for each message queue
- 32-bit message width
- Message reception and queue-not-full notification using interrupts
- Four interrupts (one to ARM Cortex-A8, one to C674x, and two to Media Controller)

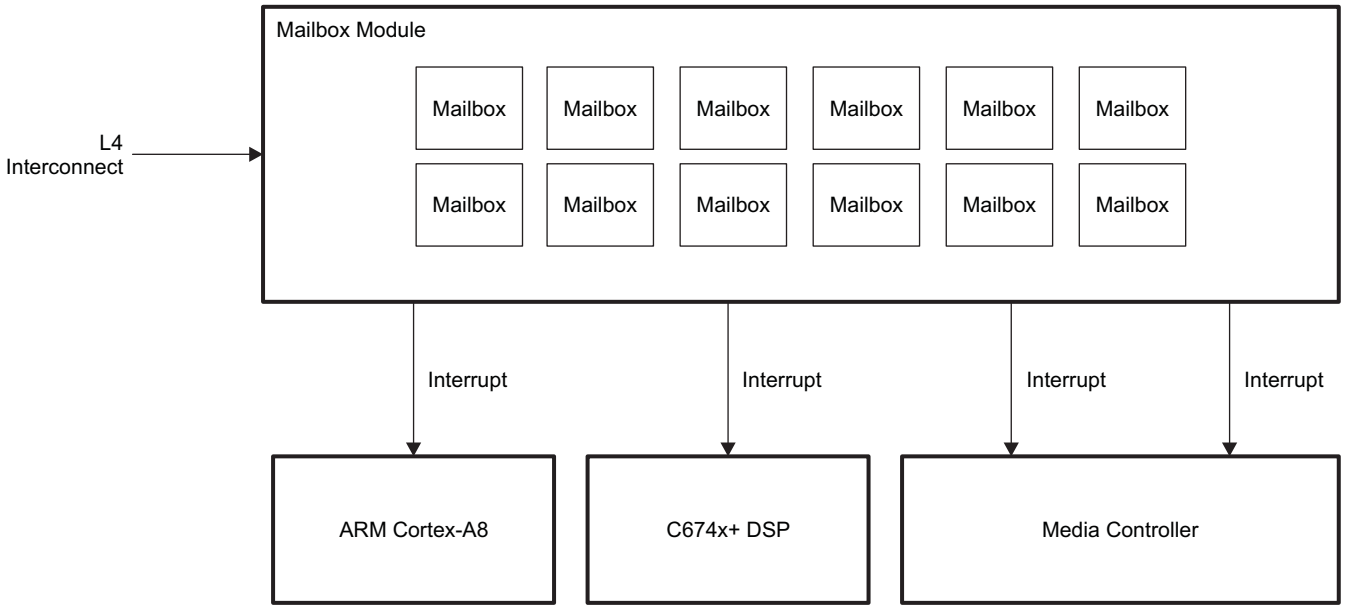


Figure 2-4. Mailbox Module Block Diagram

For more details on the Mailbox Module, see the Mailbox section of the *Chip Level Resources* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

2.12 Memory Map Summary

The device has multiple on-chip memories associated with its two processors and various subsystems. To help simplify software development a unified memory map is used where possible to maintain a consistent view of device resources across all bus masters.

2.12.1 L3 Memory Map

Table 2-3 shows the L3 memory map for all system masters (including Cortex-A8). Table 2-3 and Table 2-6 show the memory map of the C674x DSP which has limited access to the following peripherals: McASPx, McBSP, UARTx, I2Cx, SPIx, EDMA, GPIO/INT, GPMC, DDRx, EMAC, PCIe, Timers, and USB. Table 2-4 shows the memory map for the C674x DSP.

For more details on the interconnect topology and connectivity across the L3 and L4 interconnects, see Table 7-17, *System Interconnect*.

Table 2-3. L3 Memory Map

2.12.4 L4 Memory Map

The L4 Fast Peripheral Domain, L4 Slow Peripheral Domain regions of the memory maps above are broken out into Table 2-6 and Table 2-7.

For more details on the interconnect topology and connectivity across the L3 and L4 interconnects, see Table 7-17, *System Interconnect*.

(1) These regions decoded internally by the Cortex™-A8 Subsystem and are not physically part of the L4 Slow. They are included here only for reference when considering the Cortex™-A8 Memory Map. For Masters other than the Cortex-A8 these regions are reserved.

2.12.5 DDR DMM TILER Extended Addressing Map

The TILER includes an additional 4-GBytes of addressing range, enabled by a 33rd address bit, to access the frame buffer in rotated and mirrored views. shows the details of the TILER Extended Address Mapping. This entirety of this additional range is only accessible to the HDVPSS and ISS subsystems. However, other masters can access any one single view through the 512-MB TILER region in the base 4GByte address memory map.

Table 2-8. DDR DMM TILER Extended Address Mapping

BLOCK NAME	START ADDRESS (HEX)	END ADDRESS (HEX)	SIZE	DESCRIPTION
TILER View 0	0x1 0000_0000	0x1 1FFF_FFFF	512MB	Natural 0° View
TILER View 1	0x1 2000_0000	0x1 3FFF_FFFF	512MB	0° with Vertical Mirror View
TILER View 2	0x1 4000_0000	0x1 5FFF_FFFF	512MB	0° with Horizontal Mirror View
TILER View 3	0x1 6000_0000	0x1 7FFF_FFFF	512MB	180° View
TILER View 4	0x1 8000_0000	0x1 9FFF_FFFF	512MB	90° with Vertical Mirror View
TILER View 5	0x1 A000_0000	0x1 BFFF_FFFF	512MB	270° View
TILER View 6	0x1 C000_0000	0x1 DFFF_FFFF	512MB	90° View
TILER View 7	0x1 E000_0000	0x1 FFFF_FFFF	512MB	90° with Horizontal Mirror View

3 Device Pins

3.1 Pin Maps

Figure 3-1 through Figure 3-8 show the bottom view of the package pin assignments in eight pin maps (A, B, C, D, E, F, G, and H).

Figure 3-8. Pin Map H

3.2 Terminal Functions

The terminal functions tables identify the external signal names and their pin multiplexing, the associated pin (ball) numbers along with the mechanical package designator, the pin type (for example, I, O, Z, S, A, or GND), whether the pin has any internal pullup or pulldown resistors (for example, IPU, IPD, or DIS), the supply voltage source, and describe the function or functions on the pin. The MUXED column in the tables also identifies all peripheral pin functions multiplexed on a pin, the pin control register (PINCNTLx) that controls which peripheral pin function is selected for that particular pin, and indicates the state driven on the peripheral input (logic 0, logic 1, or PIN level) when the peripheral pin function is ***not*** selected (that is, the de-selected input state [DSIS]), and the Multi-Muxed [MM] option for that peripheral pin function). For more detailed information on device configuration, boot mode order, peripheral selection, and multiplexed/shared pin control, and so on, see Section 4, *Device Configurations* of this data manual.

3.2.1 Boot Configuration

Table 3-1. Boot Configuration Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
BOOT					
GPMC_D[15]/ **BTMODE[15]**	Y25	I	DIS DVDD_GPMC	GPMC PINCNTL104 DSIS: PIN	GPMC CS0 default GPMC_Wait enable input. This pin is multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[15] is sampled to determine the GPMC CS0 Wait enable: • 0 = Wait disabled • 1 = Wait enabled After reset, this pin functions as GPMC multiplexed data/address pin 15 (GPMC_D[15]).
GPMC_D[14]/ **BTMODE[14]**	V24	I	DIS DVDD_GPMC	GPMC PINCNTL103 DSIS: PIN	GPMC CS0 default Address/Data multiplexing mode input. These pins are multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[14:13] are sampled to determine the GPMC CS0 Address/Data multiplexing: • 00 = Not muxed • 01 = A/A/D muxed • 10 = A/D muxed • 11 = Reserved After reset, this pin functions as GPMC multiplexed data/address pins 14 through 13 (GPMC_D[14:13]).
GPMC_D[13]/ **BTMODE[13]**	U23	I	DIS DVDD_GPMC	GPMC PINCNTL102 DSIS: PIN	
GPMC_D[12]/ **BTMODE[12]**	U24	I	DIS DVDD_GPMC	GPMC PINCNTL101 DSIS: PIN	GPMC CS0 default Data Bus Width input. This pin is multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[12] is sampled to determine the GPMC CS0 bus width: • 0 = 8-bit data bus • 1 = 16-bit data bus After reset, this pin functions as GPMC multiplexed data/address pin 12 (GPMC_D[12]).
GPMC_D[11]/ **BTMODE[11]**	AA27	I	DIS DVDD_GPMC	GPMC PINCNTL100 DSIS: PIN	$\overline{\text{RSTOUT\_WD\_OUT}}$ Configuration. This pin is multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, BTMODE[11] is sampled to determine the function of the $\overline{\text{RSTOUT\_WD\_OUT}}$ pin: • 0 = $\overline{\text{RSTOUT}}$ is asserted when a Watchdog Timer reset, $\overline{\text{POR}}$, $\overline{\text{RESET}}$, or Emulation/Software-Global Cold/Warm reset occurs • 1 = $\overline{\text{RSTOUT\_WD\_OUT}}$ is asserted only when a Watchdog Timer reset occurs After reset, this pin functions as GPMC multiplexed data/address pin 11 (GPMC_D[11]).

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull during and after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.

(3) Specifies the operating I/O supply voltage for each signal

Table 3-1. Boot Configuration Terminal Functions (continued)

SIGNAL NAME	SIGNAL NO.	TYPE[1]	OTHER[2] [3]	MUXED	DESCRIPTION
GPMC_D[10]/ **BTMODE[10]**	Y26	I	DIS DVDD_GPMC	GPMC PINCNTL99 DSIS: PIN	XIP (NOR) on GPMC Configuration. This pin is multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, when the XIP (MUX0), XIP (MUX1), XIP w/ WAiT (MUX0) or XIP w/ WAiT (MUX1) bootmode is selected (see Table 4-1), BTMODE[10] is sampled to select between GPMC pin muxing options A or B shown in Table 4-2, *XIP (on GPMC) Boot Options [Muxed or Non-Muxed]*. • 0 = GPMC Option A • 1 = GPMC Option B After reset, this pin functions as GPMC multiplexed data/address pin 10 (GPMC_D[10]).
GPMC_D[9]/ **BTMODE[9]**	AB28	I	DIS DVDD_GPMC	GPMC PINCNTL98 DSIS: PIN	Ethernet PHY Configuration. These pins are multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. At reset, when EMAC bootmode is selected (see Table 4-1), BTMODE[9:8] pins are sampled to determine the function of the Ethernet PHY Mode selection. • 00 = MII (GMII) • 01 = RMII • 10 = RGMII • 11 = Reserved For more detailed information on the EMAC PHY boot modes and the EMAC pin functions selected, see Section 4.2.6, *Ethernet PHY Mode Selection*. After reset, these pins function as GPMC multiplexed data/address pins 9 and 8 (GPMC_D[9] and GPMC_D[8]).
GPMC_D[8]/ **BTMODE[8]**	Y27	I	DIS DVDD_GPMC	GPMC PINCNTL97 DSIS: PIN	
GPMC_D[7]/ **BTMODE[7]**	V25	I	DIS DVDD_GPMC	GPMC PINCNTL96 DSIS: PIN	Reserved Boot Pins. These pins are multiplexed between ARM Cortex-A8 boot mode and General-Purpose Memory Controller (GPMC) peripheral functions. For proper device operation at reset, these pins should be externally pulled low. After reset, these pins function as GPMC multiplexed data/address pins 10 through 5 (GPMC_D[7:5]).
GPMC_D[6]/ **BTMODE[6]**	U25	I	DIS DVDD_GPMC	GPMC PINCNTL95 DSIS: PIN	
GPMC_D[5]/ **BTMODE[5]**	AA28	I	DIS DVDD_GPMC	GPMC PINCNTL94 DSIS: PIN	
GPMC_D[4]/ **BTMODE[4]**	V26	I	DIS DVDD_GPMC	GPMC PINCNTL93 DSIS: PIN	ARM Cortex-A8 Boot Mode Configuration Bits. These pins are multiplexed between ARM Cortex-A8 boot mode and the General-Purpose Memory Controller (GPMC) peripheral functions. At reset, the boot mode inputs BTMODE[4:0] are sampled to determine the ARM boot configuration. For more details on the types of boot modes supported, see Section 4.2, *Boot Modes*, of this document, along with the *TMS320DM814x ROM Code Memory and Peripheral Booting* chapter of the *TMS320DM814x DaVinci™ Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8). After reset, these pins function as GPMC multiplexed data/address pins 4 through 0 (GPMC_D[4:0]).
GPMC_D[3]/ **BTMODE[3]**	W27	I	DIS DVDD_GPMC	GPMC PINCNTL92 DSIS: PIN	
GPMC_D[2]/ **BTMODE[2]**	V27	I	DIS DVDD_GPMC	GPMC PINCNTL91 DSIS: PIN	
GPMC_D[1]/ **BTMODE[1]**	Y28	I	DIS DVDD_GPMC	GPMC PINCNTL90 DSIS: PIN	
GPMC_D[0]/ **BTMODE[0]**	U26	I	DIS DVDD_GPMC	GPMC PINCNTL89 DSIS: PIN

(3) Specifies the operating I/O supply voltage for each signal

3.2.13 PCI Express (PCIe)

Table 3-24. PCI Express (PCIe) Terminal Functions

SIGNAL NAME	SIGNAL NO.	TYPE[1]	OTHER[2] [3]	DESCRIPTION
PCIE_TXP0	AD2	O	– VDDA_PCIE_1P8	PCIE Transmit Data Lane 0. When the PCIe SERDES are powered down, these pins should be left unconnected.
PCIE_TXN0	AD1	O		
PCIE_RXP0	AC2	I	– VDDA_PCIE_1P8	PCIE Receive Data Lane 0. When the PCIe SERDES are powered down, these pins should be left unconnected.
PCIE_RXN0	AC1	I		
SERDES_CLKP	AF1	I	– SERDES_CLK LDO (internal)	PCIE Serdes Reference Clock Inputs and *optional* SATA Reference Clock Inputs. Shared between PCI Express and Serial ATA. When PCI Express is not used, and these pins are not used as *optional* SATA Reference Clock Inputs, these pins can be left unconnected.
SERDES_CLKN	AF2	I	– SERDES_CLK LDO (internal)	

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State
(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.
(3) Specifies the operating I/O supply voltage for each signal

3.2.14 Reset, Interrupts, and JTAG Interface

Table 3-25. RESET, Interrupts, and JTAG Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
RESET					
$\overline{\text{RESET}}$	J5	I	IPU DVDD	– PINCNTL260	Device Reset input
$\overline{\text{POR}}$	F1	I	– DVDD	–	Power-On Reset input
$\overline{\text{RSTOUT\_WD\_OUT}}$	K6	O	DIS DVDD	– PINCNTL262	Reset output (RSTOUT) or watchdog out (WD_OUT) For more detailed information on $\overline{\text{RSTOUT\_WD\_OUT}}$ pin behavior, see Section 7.3.14, *$\overline{\text{RSTOUT\_WD\_OUT}}$ Pin*.
INTERRUPTS					
$\overline{\text{NMI}}$	H7	I	IPU DVDD	– PINCNTL261	Non-Maskable Interrupt input
GP0[31:0]	see Table 3-10	I/O	see **NOTE**	see Table 3-10	Interrupt-capable general-purpose I/Os. **NOTE:** All pins are multiplexed with other pin functions. See Table 3-10, GP0 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
GP1[31:0]	see Table 3-11	I/O	see **NOTE**	see Table 3-11	Interrupt-capable general-purpose I/Os. **NOTE:** All pins are multiplexed with other pin functions. See Table 3-11, GP1 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
GP2[31:0]	see Table 3-12	I/O	see **NOTE**	see Table 3-12	Interrupt-capable general-purpose I/Os. **NOTE:** All pins are multiplexed with other pin functions. See Table 3-12, GP2 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
GP3[31:0]	see Table 3-13	I/O	see **NOTE**	see Table 3-13	Interrupt-capable general-purpose I/Os. **NOTE:** All pins are multiplexed with other pin functions. See Table 3-13, GP3 Terminal Functions table for muxing and internal pullup/pulldown/disable details.
JTAG					
TCLK	W7	I	IPU DVDD	–	JTAG test clock input
RTCK	AD4	O	IPU/DIS DVDD	–	JTAG return clock output The internal pullup (IPU) is enabled for this pin when the device is in reset and the IPU is disabled (DIS) when reset is released.
TDI	Y7	I	IPU DVDD	–	JTAG test data input
TDO	AC5	O	IPU DVDD	–	JTAG test port data output
TMS	AA7	I	IPU DVDD	–	JTAG test port mode select input. For proper operation, ***do not*** oppose the IPU on this pin.
$\overline{\text{TRST}}$	AA4	I	IPD DVDD	–	JTAG test port reset input
VOUT[0]_R_CR[2]/ **EMU4**/ GP2[26]	AD9	I/O	IPD DVDD	VOUT[0], GP2 PINCNTL196 DSIS: PIN	Emulator pin 4
VOUT[0]_G_Y_YC[2]/ **EMU3**/ GP2[24]	AH7	I/O	IPD DVDD	VOUT[0], GP2 PINCNTL188 DSIS: PIN	Emulator pin 3

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull during and after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.

(3) Specifies the operating I/O supply voltage for each signal

Table 3-25. RESET, Interrupts, and JTAG Terminal Functions (continued)

SIGNAL NAME	SIGNAL NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
VOUT[0]_B_CB_C[2]/ **EMU2**/ GP2[22]	AG7	I/O	IPD DVDD	VOUT[0], GP0 PINCNTL180 DSIS: PIN	Emulator pin 2
EMU1	AE11	I/O	IPU DVDD	–	Emulator pin 1
EMU0	AG8	I/O	IPU DVDD	–	Emulator pin 0

3.2.15 Serial ATA (SATA) Signals

Table 3-26. Serial ATA (SATA) Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
SATA_TXN0	AB1	O	– VDDA_SATA_1P8	–	Serial ATA Data Transmit. When the SATA SERDES are powered down, these pins should be left unconnected.
SATA_TXP0	AB2	O	– VDDA_SATA_1P8	–	
SATA_RXN0	AA2	I	– VDDA_SATA_1P8	–	Serial ATA Data Receive. When the SATA SERDES are powered down, these pins should be left unconnected.
SATA_RXP0	AA1	I	– VDDA_SATA_1P8	–	
SPI[0]_SCS[1]/ SD1_SDCD/ **SATA_ACT0_LED**/ EDMA_EVT1/ TIM4_IO/ GP1[6]	AE5	O	IPU DVDD	SPI[0], SD1, EDMA, TIMER 4, GP1 PINCNTL80 DSIS: N/A	Serial ATA disk 0 Activity LED output
SERDES_CLKP	AF1	I	– SERDES_CLK LDO (internal)	–	PCIE Serdes Reference Clock Inputs and *optional* SATA Reference Clock Inputs. Shared between PCI Express and Serial ATA. When PCI Express is not used, and these pins are not used as *optional* SATA Reference Clock Inputs, these pins should be left unconnected.
SERDES_CLKN	AF2	I	– SERDES_CLK LDO (internal)	–	

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull during and after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.

(3) Specifies the operating I/O supply voltage for each signal

3.2.16 SD Signals (MMC/SD/SDIO)

Table 3-27. SD0 Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
SD0_CLK/ GP0[1]	Y6	O	IPU DVDD_SD	GP0 PINCNTL8 DSIS: 1	SD0 Clock output
SD0_CMD/ SD1_CMD/ GP0[2]	N1	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL9 DSIS: 1	SD0 Command input/output
SD0_DAT[0]/ SD1_DAT[4]/ GP0[3]	R7	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL10 DSIS: PIN	SD0 Data0 I/O. Functions as data bit 0 for 4-/8-bit SD mode and single data bit for 1-bit SD mode.
SD0_DAT[1]_$\overline{\text{SDIRQ}}$/ SD1_DAT[5]/ GP0[4]	Y5	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL11 DSIS: PIN	SD0 Data1 I/O. Functions as data bit 1 for 4-/8-bit SD mode and as an IRQ input for 1-bit SD mode.
SD0_DAT[2]_SDR$\overline{\text{W}}$/ SD1_DAT[6]/ GP0[5]	Y3	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL12 DSIS: PIN	SD0 Data2 I/O. Functions as data bit 2 for 4-/8-bit SD mode and as a Read Wait input for 1-bit SD mode.
SD0_DAT[3]/ SD1_DAT[7]/ GP0[6]	Y4	I/O	IPU DVDD_SD	SD1, GP0 PINCNTL13 DSIS: PIN	SD0 Data3 I/O. Functions as data bit 3 for 4-/8-bit SD mode.
MCA[1]_AXR[0]/ **SD0_DAT[4]**/	V4	I/O	IPU DVDD	MCA[1] PINCNTL35 DSIS: PIN	SD0 Data4 I/O. Functions as data bit 4 for 8-bit SD mode.
MCA[1]_AXR[1]/ **SD0_DAT[5]**/	T6	I/O	IPU DVDD	MCA[1], SC0 PINCNTL36 DSIS: PIN	SD0 Data5 I/O. Functions as data bit 5 for 8-bit SD mode.
MCA[2]_AXR[0]/ **SD0_DAT[6]**/ UART5_RXD/ GP0[12]	N2	I/O	IPU DVDD	MCA[2], UART5, GP0 PINCNTL41 DSIS: PIN	SD0 Data6 I/O. Functions as data bit 6 for 8-bit SD mode.
MCA[2]_AXR[1]/ **SD0_DAT[7]**/ UART5_TXD/ GP0[13]	V6	I/O	IPU DVDD	MCA[2], UART5, GP0 PINCNTL42 DSIS: PIN	SD0 Data7 I/O. Functions as data bit 7 for 8-bit SD mode.
$\overline{\text{UART0\_CTS}}$/ UART4_RXD/ $\overline{\text{DCAN1\_TX}}$/ $\overline{\text{SPI[1]\_SCS[3]}}$/ **SD0_SDCD**	AE6	I	IPD DVDD	UART0, UART4, DCAN1, SPI[1] PINCNTL72 DSIS: 1	SD0 Card Detect input

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State
(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.
(3) Specifies the operating I/O supply voltage for each signal

Table 3-28. SD1 Terminal Functions

3.2.21 USB

Table 3-42. USB Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
USB0					
USB0_DP	AG11	A I/O	– VDDA_USB_3P3	–	USB0 bidirectional data differential signal pair [plus/minus].
USB0_DM	AH11	A I/O	– VDDA_USB_3P3	–	When the USB0 PHY is powered down, these pins should be left unconnected.
USB0_ID	AG10	A I	– VDDA_USB_3P3	–	USB0 OTG identification input. When the USB0 PHY is powered down, this pin should be left unconnected.
USB0_CE	AH10	A O	– VDDA_USB_3P3	–	USB0 charger enable. When the USB0 PHY is powered down, this pin should be left unconnected.
USB0_VBUSIN	AG12	A I	– VDDA_USB_3P3	–	5-V USB0 VBUS comparator input. This analog input pin senses the level of the USB VBUS voltage and should connect directly to the USB VBUS voltage. When the USB0 PHY is powered down, this pin should be left unconnected.
USB0_DRVVBUS/ GP0[7]	AF11	O	IPD DVDD	GP0 PINCNTL270 DSIS: N/A	When this pin is used as USB0_DRVVBUS and the USB0 Controller is operating as a Host, this signal is used by the USB0 Controller to enable the external VBUS charge pump. When the USB0 PHY is powered down, this pin should be left unconnected.
USB1					
USB1_DP	AG13	A I/O	– VDDA_USB_3P3	–	USB1 bidirectional data differential signal pair [plus/minus].
USB1_DM	AH13	A I/O	– VDDA_USB_3P3	–	When the USB1 PHY is powered down, these pins should be left unconnected.
USB1_ID	AH12	A I	– VDDA_USB_3P3	–	USB1 OTG identification input. When the USB1 PHY is powered down, this pin should be left unconnected.
USB1_CE	AH14	A O	– VDDA_USB_3P3	–	USB1 charger enable. When the USB1 PHY is powered down, this pin should be left unconnected.
USB1_VBUSIN	AG14	A I	– VDDA_USB_3P3	–	5-V USB1 VBUS comparator input. This analog input pin senses the level of the USB VBUS voltage and should connect directly to the USB VBUS voltage. When the USB1 PHY is powered down, this pin should be left unconnected.
AUD_CLKIN0/ MCA[0]_AXR[7]/ MCA[0]_AHCLKX/ MCA[3]_AHCLKX/ **USB1_DRVVBUS**	L5	O	IPD DVDD	AUD_CLKIN0, MCA[0], MCA[3], PINCNTL14 DSIS: N/A	When this pin is used as USB1_DRVVBUS and the USB1 Controller is operating as a Host, this signal is used by the USB1 Controller to enable the external VBUS charge pump. When the USB1 PHY is powered down, this pin should be left unconnected.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State
(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.
(3) Specifies the operating I/O supply voltage for each signal

3.2.22 Video Input (Digital)

Table 3-43. Video Input 0 (Digital) Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
Video Input 0 (Digital)					
VIN[0]B_CLK/ CLKOUT0/ GP1[9]	AE17	I	IPD DVDD	CLKOUT0, GP1 PINCNTL134 DSIS: 0	Video Input 0 Port B Clock input. Input clock for 8-bit Port B video capture. This signal is not used in 16-bit and 24-bit capture modes.
VIN[0]A_CLK/ GP2[2]	AB20	I	IPD DVDD	GP2 PINCNTL137 DSIS: 0	Video Input 0 Port A Clock input. Input clock for 8-bit , 16-bit, or 24-bit Port A video capture.

3.2.23 Video Output (Digital)

Table 3-45. Video Output 0 (Digital) Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
Video Output 0					
VOUT[0]_CLK	AD12	O	IPD DVDD	– PINCNTL176	Video Output Clock output.
VOUT[0]_G_Y_YC[9]	AF14	O	IPD DVDD	– PINCNTL195	Video Output Data. These signals represent the 8 MSBs of G/Y/YC video data. For RGB mode they are green data bits, for YUV444 mode they are Y data bits, for Y/C mode they are Y (Luma) data bits and for BT.656 mode they are multiplexed Y/Cb/Cr (Luma and Chroma) data bits.
VOUT[0]_G_Y_YC[8]	AE14	O	IPD DVDD	– PINCNTL194	
VOUT[0]_G_Y_YC[7]	AD14	O	IPD DVDD	– PINCNTL193	
VOUT[0]_G_Y_YC[6]	AA8	O	IPD DVDD	– PINCNTL192	
VOUT[0]_G_Y_YC[5]	AB12	O	IPD DVDD	– PINCNTL191	
VOUT[0]_G_Y_YC[4]	AB8	O	IPD DVDD	– PINCNTL190	
VOUT[0]_G_Y_YC[3]/ GP2[25]	AH15	O	IPD DVDD	GP2 PINCNTL189 DSIS: PIN	
VOUT[0]_G_Y_YC[2]/ EMU3/ GP2[24]	AH7	O	IPD DVDD	EMU, GP2 PINCNTL188 DSIS: PIN	
VOUT[0]_B_CB_C[9]	AG15	O	IPD DVDD	– PINCNTL187	Video Output Data. These signals represent the 8 MSBs of B/CB/C video data. For RGB mode they are blue data bits, for YUV444 mode they are Cb (Chroma) data bits, for Y/C mode they are multiplexed Cb/Cr (Chroma) data bits and for BT.656 mode they are unused.
VOUT[0]_B_CB_C[8]	AF15	O	IPD DVDD	– PINCNTL186	
VOUT[0]_B_CB_C[7]	AB10	O	IPD DVDD	– PINCNTL185	
VOUT[0]_B_CB_C[6]	AC10	O	IPD DVDD	– PINCNTL184	
VOUT[0]_B_CB_C[5]	AD15	O	IPD DVDD	– PINCNTL183	
VOUT[0]_B_CB_C[4]	AD11	O	IPD DVDD	– PINCNTL182	
VOUT[0]_B_CB_C[3]/ GP2[23]	AE15	O	IPD DVDD	GP2 PINCNTL181 DSIS: PIN	
VOUT[0]_B_CB_C[2]/ EMU2/ GP2[22]	AG7	O	IPD DVDD	EMU2, GP2 PINCNTL180 DSIS: PIN	

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State
(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.
(3) Specifies the operating I/O supply voltage for each signal

Table 3-45. Video Output 0 (Digital) Terminal Functions (continued)

SIGNAL NAME	SIGNAL NO.	TYPE(1)	OTHER(2) (3)	MUXED	DESCRIPTION
VOUT[0]_R_CR[9]/	AC13	O	IPD DVDD	– PINCNTL203	Video Output Data. These signals represent the 8 MSBs of R/CR video data. For RGB mode they are red data bits, for YUV444 mode they are Cr (Chroma) data bits, for Y/C mode and BT.656 modes they are unused.
VOUT[0]_R_CR[8]/	AE8	O	IPD DVDD	– PINCNTL202	
VOUT[0]_R_CR[7]/	AF12	O	IPD DVDD	– PINCNTL201	
VOUT[0]_R_CR[6]/	AF6	O	IPD DVDD	– PINCNTL200	
VOUT[0]_R_CR[5]/	AF8	O	IPD DVDD	– PINCNTL199	
VOUT[0]_R_CR[4]/	AA9	O	IPD DVDD	– PINCNTL198

3.2.24 Video Output (Analog, TV)

Table 3-47. Video Outupt (Analog, TV) Terminal Functions

SIGNAL NAME	NO.	TYPE(1)	OTHER(2) (3)	DESCRIPTION
VIDEO INTERFACES (TV)				
TV_OUT0	AH24	O	VDDA_VDAC_1P8	Composite/S-Video (Luminance) Amplifier Output. In **Normal mode** (internal amplifier used), this pin drives the 75-Ω TV load. An external resistor (Rout) should be connected between this pin and the TV_VFB0 pin and be placed as close to the pins as possible. The nominal value of Rout is 2700 Ω. In **TVOUT Bypass mode** (internal amplifier *not* used), this pin is *not* used. When this pin is not used or the TV output is powered-down, this pin should be left unconnected.
TV_OUT1	AH22	O	VDDA_VDAC_1P8	S-Video (Chrominance) Amplifier Output. In **Normal mode** (internal amplifier used), this pin drives the 75-Ω TV load. An external resistor (Rout) should be connected between this pin and the TV_VFB1 pin and be placed as close to the pins as possible. The nominal value of Rout is 2700 Ω. In **TVOUT Bypass mode** (internal amplifier *not* used), this pin is *not* used. When this pin is not used or the TV output is powered-down, this pin should be left unconnected.
TV_VFB0	AG23	A O	VDDA_VDAC_1P8	Composite/S-Video (Luminance) Feedback. In **Normal mode** (internal amplifier used), this pin acts as the buffer feedback node. An external resistor (Rout) should be connected between this pin and the TV_OUT0 pin. In **TVOUT Bypass mode** (internal amplifier *not* used), this pin acts as the direct Video DAC output and should be connected to ground through a load resistor (Rload) and to an external video amplifier. The nominal value of Rload is 1500 Ω. When this pin is **not used** or the TV output is powered-down, this pin should be left unconnected.
TV_VFB1	AG22	A O	VDDA_VDAC_1P8	S-Video (Chrominance) Feedback. In **Normal mode** (internal amplifier used), this pin acts as the buffer feedback node. An external resistor (Rout) should be connected between this pin and the TV_OUT1 pin. In **TVOUT Bypass mode** (internal amplifier not used), it acts as the direct Video DAC output and should be connected to ground through a load resistor (Rload) and to an external video amplifier. The nominal value of Rload is 1500 Ω. When this pin is **not used** or the TV output is powered-down, this pin should be left unconnected.

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State
(2) IPD = Internal Pulldown Active, IPU = Internal Pullup Active, DIS = Internal Pull Disabled. This represents the default state of the Internal Pull after Reset. For more detailed information on pullup/pulldown resistors and situations where external pullup/pulldown resistors are required, see Section 4.5.1, *Pullup/Pulldown Resistors* and Section 7.3.17, *Pin Behaviors at Reset*.
(3) Specifies the operating I/O supply voltage for each signal

Table 3-47. Video Outupt (Analog, TV) Terminal Functions (continued)

SIGNAL NAME	SIGNAL NO.	TYPE[1]	OTHER[2] [3]	DESCRIPTION
TV_RSET	AH23	A	_ VDDA_VDAC_1P8	TV Input Reference Current Setting. An external resistor (Rset) should be connected between this pin and VSSA_VDAC to set the reference current of the video DAC. The value of the resistor depends on the mode of operation. In **Normal mode** (internal amplifier used), the nominal value for Rset is 4700 Ω. In **TVOUT Bypass mode** (internal amplifier *not* used), the nominal value for Rset is 10000 Ω. When the TV output is **not used**, this pin should be connected to ground (VSS).

3.2.25 Reserved Pins

Table 3-48. Reserved Terminal Functions

SIGNAL NAME	SIGNAL NO.	TYPE[1]	OTHER	DESCRIPTION
RSV1	AD8	O		Reserved. (Leave unconnected, ***do not*** connect to power or ground.)
RSV2	U8	O		Reserved. (Leave unconnected, ***do not*** connect to power or ground.)
RSV3	V8	O		Reserved. (Leave unconnected, ***do not*** connect to power or ground.)
RSV4	Y14	I		Reserved. (Leave unconnected, ***do not*** connect to power or ground.)
RSV5	AC8	I		
RSV6	L27	I		Reserved. (Leave unconnected, ***do not*** connect to power or ground.)
RSV7	L28	I		
RSV8	M27	I		
RSV9	M28	I		
RSV10	N28	I		
RSV11	N27	I		
RSV12	P28	I		
RSV13	P27	I		
RSV14	R27	I		
RSV15	R28	I		
RSV16	U1	I		Reserved. (Leave unconnected, ***do not*** connect to power or ground.)
RSV17	U2	I		Reserved. (Leave unconnected, ***do not*** connect to power or ground.)

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

3.2.26 Supply Voltages

Table 3-49. Supply Voltages Terminal Functions

SIGNAL NAME	SIGNAL NO.	TYPE(1)	OTHER	DESCRIPTION
VREFSSTL_DDR[0]	G15	S		Reference Power Supply DDR[0]
VREFSSTL_DDR[1]	G14	S		Reference Power Supply DDR[1]
CVDD	K9, K12, K18, L15, L17, L19, M16, M18, N17, N19, P12, P14, P16, R15, R17, R19, T12, U11, U13, U17, U19, W11	S		Variable Voltage Supply for the CORE_L Core Logic Voltage Domain For actual voltage supply ranges, see Section 6.2, *Recommended Operating Conditions*.
CVDD_ARM	T14, T15, T16, U15, U16, V15, V16	S		Variable Voltage Supply for the ARM_L Core Logic Voltage Domain For actual voltage supply ranges, see Section 6.2, *Recommended Operating Conditions*.
CVDD_DSP	K10, L9, L10, L11, L12, M10, M12, N9	S		Variable Voltage Supply for the DSP_L Core Logic Voltage Domain For actual voltage supply ranges, see Section 6.2, *Recommended Operating Conditions*.
CVDD_HDVICP	L14, M13, M14, N13, N14	S		Variable Voltage Supply for the HDVICP_L Core Logic Voltage Domain For actual voltage supply ranges, see Section 6.2, *Recommended Operating Conditions*.
DVDD	M8, N7, P8, T7, U21, U22, V20,Y11, Y16, AA15, AA17, AB14, AB16	S		3.3 V/1.8 V Power Supply for General I/Os
DVDD_GPMC	K20, L21, M20	S		3.3 V/1.8 V Power Supply for GPMC I/Os (that is, GPMC, SD2, and so forth)
DVDD_GPMCB	P20, T20	S		3.3 V/1.8 V Power Supply for GPMCB I/Os
DVDD_SD	P7, P9	S		3.3 V/1.8 V Power Supply for MMC/SD/SDIO I/Os (specifically, SD0, SD1, and pin W6)
DVDD_DDR[0]	E20, E21, G16, H16, H17, J15, J16, J17, J18	S		1.5 V/1.8 V Power Supply for DDR[0] I/Os
DVDD_DDR[1]	E8, E9, G13, H12, H13, H14, J10, J11, J13	S		1.5 V/1.8 V Power Supply for DDR[1] I/Os
DVDD_M	R10	S		1.8 V Power Supply . For proper device operation, this pin ***must*** always be connected to a 1.8-V Power Supply.
DVDD_C	W19, W20	S		3.3 V/1.8 V Power Supply for Camera I/F I/Os
VDDA_ARMPLL_1P8	R13	S		1.8 V Analog Power Supply for PLL_ARM and PLL_SGX
VDDA_DSPPLL_1P8	P11	S		1.8 V Analog Power Supply for PLL_DSP and PLL_HDVICP
VDDA_VID0PLL_1P8	AB18	S		1.8 V Analog Power Supply for PLL_VIDEO0
VDDA_VID1PLL_1P8	AA18	S		1.8 V Analog Power Supply for PLL_VIDEO1
VDDA_AUDIOPLL_1P8	R18	S		1.8 V Analog Power Supply for PLL_AUDIO
VDDA_DDRPLL_1P8	H15	S		1.8 V Analog Power Supply for PLL_DDR

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

Table 3-49. Supply Voltages Terminal Functions (continued)

SIGNAL NAME	SIGNAL NO.	TYPE(1)	OTHER	DESCRIPTION
VDDA_L3PLL_1P8	N18	S		1.8 V Analog Power Supply for PLL_L3, PLL_HDVPSS, and PLL_MEDIACTL
VDDA_PCIE_1P8	W9, W10	S		1.8 V Analog Power Supply for PCIe. For proper device operation, this pin ***must*** always be connected to a 1.8-V Power Supply, even if the PCIe is not being used.
VDDA_SATA_1P8	U9, U10	S		1.8 V Analog Power Supply for SATA. For proper device operation, this pin ***must*** always be connected to a 1.8-V Power Supply, even if the SATA is not being used.
VDDA_HDMI_1P8	W18	S		1.8 V Analog Power Supply for HDMI. For proper device operation, this pin ***must*** always be connected to a 1.8-V Power Supply, even if the HDMI is not being used.
VDDA_USB0_1P8	AA12	S		1.8 V Analog Power Supply for USB0. For proper device operation, this pin ***must*** always be connected to a 1.8-V Power Supply, even if the USB0 is not being used.
VDDA_USB1_1P8	W13	S		1.8 V Analog Power Supply for USB1. For proper device operation, this pin ***must*** always be connected to a 1.8-V Power Supply, even if the USB1 is not being used.
VDDA_VDAC_1P8	AB19	S		1.8 V Reference Power Supply for VDAC. For proper device operation, this pin ***must*** always be connected to a 1.8-V Power Supply, even if the VDAC is not being used.
VDDA_USB_3P3	AA13	S		3.3 V Analog Power Supply for USB0 and USB1. For proper device operation, this pin ***must*** always be connected to a 3.3-V Power Supply, even if USB0 and USB1 are not being used.
VDDA_1P8	L20, M7, M22, R20, U7, V10, W15, Y13	S		1.8 V Power Supply for on-chip LDOs and I/O biasing
LDOCAP_ARM	W14	A		ARM Cortex-A8 VBB LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_ARMRAM	V14	A		ARM Cortex-A8 RAM LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_RAM0	P18	A		CORE RAM0 LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_RAM1	R11	A		CORE RAM1 LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_RAM2	L18	A		CORE RAM2 LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_DSP	P10	A		C674x DSP VBB LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_DSPRAM	M11	A		C674x DSP RAM LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_HDVICP	N10	A		HDVICP2 VBB LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_HDVICPRAM	N11	A		HDVICP2 RAM LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_SGX	T10	A		SGX530 VBB LDO output. This pin must always be connected via a 1-uF capacitor to VSS.
LDOCAP_SERDESCLK	T11	A		SERDES_CLKP/N Pins LDO output. This pin must always be connected via a 1-uF capacitor to VSS.

3.2.27 Ground Pins (VSS)

Table 3-50. Ground Terminal Functions

SIGNAL NAME	SIGNAL NO.	TYPE(1)	OTHER	DESCRIPTION
VSS	A1, A12, A17, A28, D9, D20, J12, J14, J19, K11, K13, K14, K15, K16, K17, K19, L8, L13, L16, L22, M9, M15, M17, M19, M21, N8, N12, N15, N16, N20, N21, N22, P13, P15, P17, P19, P21, R8, R9, R12, R14, R16, R21, R22, T8, T9, T13, T17, T18, T19, T21, T22, U12, U14, U18, U20, V7, V9, V11, V17, V19, V21, W12, W16, W17, Y1, Y2, Y10, Y12, Y15, Y17, Y18, Y19, AA14, AA16, AD21, AE1, AE2, AE9, AE20, AF23, AG1, AH1, AH28	GND		Ground (GND)
VSSA_VDAC	AA19	GND		Analog GND for VDAC. For proper device operation, this pin *must* always be connected to ground, even if the VDAC is not being used.
VSSA_HDMI	V18	GND		Analog GND for HDMI For proper device operation, this pin *must* always be connected to ground, even if the HDMI is not being used.
VSSA_USB	V12, V13	GND		Analog GND for USB0 and USB1. For proper device operation, this pin *must* always be connected to ground, even if USB0 and USB1 are not being used.
VSSA_DEVOSC	AG3	GND		Ground for Device Oscillator
VSSA_AUXOSC	R2	GND		Ground for Auxiliary Oscillator

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground, A = Analog signal, MM = Multi Muxed, DSIS = De-selected Input State

4 Device Configurations

4.1 Control Module Registers

4.2 Boot Modes

The state of the device after boot is determined by sampling the input states of the BTMODE[15:0] pins when device reset ($\overline{\text{POR}}$ or $\overline{\text{RESET}}$) is de-asserted. The sampled values are latched into the CONTROL_STATUS register, which is part of the Control Module. The BTMODE[15:11] values determine the following system boot settings:

- $\overline{\text{RSTOUT\_WD\_OUT}}$ Control
- GPMC CS0 Default Data Bus Width, Wait Enable, and Address/Data Multiplexing

For additional details on BTMODE[15:11] pin functions, see Table 3-1, *Boot Configuration Terminal Functions*.

The BTMODE[4:0] values determine the boot mode order according to Table 4-1, *Boot Mode Order*. The 1st boot mode listed for each BTMODE[4:0] configuration is executed as the primary boot mode. If the primary boot mode fails, the 2nd, 3rd, and 4th boot modes are executed in that order until a successful boot is completed.

The BTMODE[7:5] pins are RESERVED and should be pulled down as indicated inTable 3-1, *Boot Configuration Terminal Functions*.

When the EMAC bootmode is selected (see Table 4-1), the sampled value from BTMODE[9:8] pins are used to determine the Ethernet PHY Mode selection (see Table 4-7).

When the XIP (MUX0), XIP (MUX1), XIP w/ WAiT (MUX0) or XIP w/ WAiT (MUX1) bootmode is selected (see Table 4-1), the sampled value from BTMODE[10] pin is used to select between GPMC pin muxing options shown in Table 4-2, *XIP (on GPMC) Boot Options [Muxed or Non-Muxed]*.

For more detailed information on booting the device, see the *ROM Code Memory and Peripheral Booting* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

(1) GPMC CS0 eXecute In Place (XIP) boot for NOR/OneNAND/ROM. MUX0/1 refers to the multiplexing option for the GPMC_A[12:0] pins. For more detailed information on booting the device, including which pins are used for each boot mode, see the *ROM Code Memory and Peripheral Booting* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

(2) When the XIP (MUX0), XIP (MUX1), XIP w/ WAiT (MUX0) or XIP w/ WAiT (MUX1) bootmode is selected, the sampled value from BTMODE[10] pin is used to select between GPMC pin configuration options shown in Table 4-2, *XIP (on GPMC) Boot Options*.

(3) When the EMAC bootmode is selected, the sampled value from BTMODE[9:8] pins are used to determine the Ethernet PHY Mode Selection (see Table 4-7).

(4) When the PCIe bootmode is selected (PCIE_32 or PCI_64), the sampled value from BTMODE[15:12] pins are used to determine the addressing options. For more detailed information on the PCIe addressing options, see the *ROM Code Memory and Peripheral Booting* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

4.2.1 XIP (NOR) Boot Options

Table 4-2 shows the XIP (NOR) boot mode GPMC pin configuration options (Option A: BTMODE[10] = 0 and Option B: BTMODE[10] = 1). For Option B, the pull state on select pins is reconfigured to IPD and remains IPD after boot until the user software reconfigures it.

Table 4-2. XIP (on GPMC) Boot Options

SIGNAL NAME	PIN NO.	OTHER CONDITIONS	CONTROLLED I/O FUNCTION DURING XIP (NOR) BOOT

4.2.2 NAND Flash Boot

Table 4-3 lists the device pins that are configured by the ROM for the NAND Flash boot mode.

NOTE: Table 4-3 lists the configuration of the GPMC_CLK pin (pin mux and pull state) in NAND bootmodes.

The NAND flash memory is not XIP and requires shadowing before the code can be executed.

Table 4-3. Pins Used in NAND FLASH Bootmode

SIGNAL NAME	PIN NO.	TYPE	OTHER CONDITIONS
GPMC_CS[0]/*	T28	O	BTMODE[12] = 0b (8-bit Mode) BTMODE[12] = 1b (16-bit Mode) BTMODE[14:13] = 00b (GPMC CS0 not muxed) BTMODE[15] = 0b (wait disabled)
GPMC_ADV_ALE/*	M26	O

(1) GPMC_CLK/* is not configured in BTMODE[10] = 1 [OPTION B]

4.2.3 NAND I2C Boot (I2C EEPROM)

Table 4-4 lists the device pins that are configured by the ROM for the NAND I2C boot mode.

Table 4-4. Pins Used in NAND I2C Bootmode

SIGNAL NAME	PIN NO.	TYPE
I2C[0]_SCL	AC4	I/O
I2C[0]_SDA	AB6	I/O

4.2.4 MMC/SD Cards Boot

Table 4-5 lists the device pins that are configured by the ROM for the MMC/SD boot mode.

Table 4-5. Pins Used in MMC/SD Bootmode

SIGNAL NAME	PIN NO.	TYPE
SD1_CLK	P3	O
SD1_CMD/GP0[0] [MUX0]	P2	O
SD1_DAT[0]	P1	I/O
SD1_DAT[1]_SDIRQ	P5	I/O
SD_DAT[2]_SDRW	P4	I/O
SD1_DAT[3]	P6	I/O

4.2.5 SPI Boot

Table 4-6 lists the device pins that are configured by the ROM for the SPI boot mode.

Table 4-6. Pins Used in SPI Bootmode

SIGNAL NAME	PIN NO.	TYPE
$\overline{\text{SPI[0]\_SCS[0]}}$	AD6	I/O
SPI[0]_D[0] (MISO)	AE3	I/O
SPI[0]_D[1] (MOSI)	AF3	I/O
SPI[0]_SCLK	AC7	I/O

4.2.6 Ethernet PHY Mode Selection

When the EMAC bootmode is selected, via the BTMODE[4:0] pins (see Table 4-1), Table 4-7 shows the sampled value of BTMODE[9:8] pins and the Ethernet PHY Mode selection.

Table 4-8 shows the signal names (pin functions) and the associated pin numbers selected in each particular EMAC mode.

Table 4-7. EMAC PHY Mode Selection

BTMODE[9:8]	ETHERNET PHY MODE SELECTION
00b	MII
01b	RMII
10b	RGMII
11b	RESERVED

4.2.7 PCIe Bootmode (PCIE_32 and PCIE_64)

Table 4-9 lists the device pins that are configured by the ROM for the PCIe boot mode.

Table 4-9. Pins Used in PCIe Bootmode

SIGNAL NAME	PIN NO.	TYPE
PCIE_TXP0	AD2	O
PCIE_TXN0	AD1	O
PCIE_RXP0	AC2	I
PCIE_RXN0	AC1	I
SERDES_CLKIP	AF1	I
SERDES_CLKN	AF2	I

4.2.8 UART Bootmode

Table 4-10 lists the device pins that are configured by the ROM for the UART boot mode.

Table 4-10. Pins Used in UART Bootmode

SIGNAL NAME	PIN NO.	TYPE
UART0_RXD	AH5	I
UART0_TXD	AG5	O

4.3 Pin Multiplexing Control

Device level pin multiplexing is controlled on a pin-by-pin basis by the MUXMODE bits of the PINCNTL1 – PINCNTL270 registers in the Control Module.

Pin multiplexing selects which one of several peripheral pin functions controls the pin's I/O buffer output data values. Table 4-11 shows the peripheral pin functions associated with each MUXMODE setting for all multiplexed pins. The default pin multiplexing control for almost every pin is to select MUXMODE = 0x0, in which case the pin's I/O buffer is 3-stated.

In most cases, the input from each pin is routed to all of the peripherals that share the pin, regardless of the MUXMODE setting. However, in some cases a constant "0" or "1" value is routed to the associated peripheral when its peripheral function is not selected to control any output pin. For more details on the De-Selected Input State (DSIS), see the "MUXED" columns of each Terminal Functions table (Section 3.2, *Terminal Functions*).

Some peripheral pin functions can be routed to more than one device pin. These types of peripheral pin functions are called Multimuxed (MM) and may have different Switching Characteristics and Timing Requirements for each device pin option. The Multimuxed peripheral pin functions are labeled as "MM" in Terminal Functions tables in Section 3.2, *Terminal Functions* and the associated timings for each MM pin option are in Section 8, *Peripheral Information and Timings*.

For more detailed information on the Pin Control 1 through Pin Control 270 (PINCNTLx) registers breakout, see Figure 4-1 and Table 4-11. For the register reset values of each PINCNTLx register, see Table 4-13, *PINCNTLx Registers MUXMODE Functions*.

RESERVED		MUXMODE[7:0] (see Table 4-13)	
R - 0000 0000		R/W - 0000 0000	

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Table 4-11. PINCNTL1 – PINCNTL270 (PINCNTLx) Registers Bit Descriptions

Bit	Field	Description	Comments
31:20	RESERVED	Reserved. Read only, writes have no effect.	For PINCNTLx register reset value examples, see Table 4-12, *PNICNTLx Register Reset Value Examples*. For the full register reset values of all PINCNTLx registers, see Table 4-13, *PINCNTLx Registers MUXMODE Functions*.
19	RSV	Reserved. This bit ***must*** always be written with the reset (default) value. (See Table 4-13 for full register reset value)	
18	RXACTIVE	Receiver Enable 0 = Receiver Disabled 1 = Receiver Enabled	
17	PLLTYPSEL	Pullup/Pulldown Type Selection bit 0 = Pulldown (PD) selected 1 = Pullup (PU) selected	
16	PLLUDEN	Pullup/Pulldown Enable bit 0 = PU/PD enabled 1 = PU/PD disabled	
15:8	RESERVED	Reserved. Read only, writes have no effect.	
7:0	MUXMODE[7:0]	MUXMODE Selection bits These bits select the multiplexed mode pin function settings (seeTable 4-13, *PINCNTLx Registers MUXMODE Functions*). A value of zero results in the pin being tri-stated. Non-zero values other than those shown in Table 4-13 are Reserved.	

Table 4-12. PINCNTLx Register Reset Value Examples

(1) "(M0)" represents multimuxed option "0" for this pin function, "(M1)" represents multimuxed option "1" for this pin function, ... etc.

(2) Within this MUXMODE setting, EMAC[x] GMII or RGMII pin functions are selected via the RGMII0_EN and/or RGMII1_EN bits (8 and 9, respectively) in the GMII_SEL register [0x4814_0650] of the Control Module. "0" = GMII (default) and "1" = RGMII.

4.4 Handling Unused Pins

When device signal pins are unused in the system, they can be left unconnected unless otherwise noted in the Terminal Functions tables (see Section 3.2). For unused input pins, the internal pull resistor should be enabled, or an external pull resistor should be used, to prevent floating inputs. Unless otherwise noted, all supply pins must always be connected to the correct voltage, even when their associated signal pins are unused.

4.5 DeBugging Considerations

4.5.1 Pullup/Pulldown Resistors

Proper board design should ensure that input pins to the TMS320DM814x DaVinci™ Digital Media Processsors device always be at a valid logic level and not floating. This may be achieved via pullup/pulldown resistors. The device features internal pullup (IPU) and internal pulldown (IPD) resistors on most pins to eliminate the need, unless otherwise noted, for external pullup/pulldown resistors.

An external pullup/pulldown resistor needs to be used in the following situations:

- *Boot Configuration Pins*: If the pin is both routed out and 3-stated (not driven), an external pullup/pulldown resistor is ***strongly recommended***, even if the IPU/IPD matches the desired value/state.
- *Other Input Pins*: If the IPU/IPD *does not* match the desired value/state, use an external pullup/pulldown resistor to pull the signal to the opposite rail.

For the boot configuration pins (listed in Table 3-1, *Boot Configuration Terminal Functions*), if they are both routed out and 3-stated (not driven), it is ***strongly recommended*** that an external pullup/pulldown resistor be implemented. Although, internal pullup/pulldown resistors exist on these pins and they may match the desired configuration value, providing external connectivity can help ensure that valid logic levels are latched on these device boot configuration pins. In addition, applying external pullup/pulldown resistors on the boot and configuration pins adds convenience to the user in debugging and flexibility in switching operating modes.

Tips for choosing an external pullup/pulldown resistor:

- Consider the total amount of current that may pass through the pullup or pulldown resistor. Make sure to include the leakage currents of all the devices connected to the net, as well as any internal pullup or pulldown resistors.
- Decide a target value for the net. For a pulldown resistor, this should be below the lowest V_{IL} level of all inputs connected to the net. For a pullup resistor, this should be above the highest V_{IH} level of all inputs on the net. A reasonable choice would be to target the V_{OL} or V_{OH} levels for the logic family of the limiting device; which, by definition, have margin to the V_{IL} and V_{IH} levels.
- Select a pullup/pulldown resistor with the largest possible value; but, which can still ensure that the net will reach the target pulled value when maximum current from all devices on the net is flowing through the resistor. The current to be considered includes leakage current plus, any other internal and external pullup/pulldown resistors on the net.
- For bidirectional nets, there is an additional consideration which sets a lower limit on the resistance value of the external resistor. Verify that the resistance is small enough that the weakest output buffer can drive the net to the opposite logic level (including margin).
- Remember to include tolerances when selecting the resistor value.
- For pullup resistors, also remember to include tolerances on the DV_{DD} rail.

For most systems, a 1-kΩ resistor can be used to oppose the IPU/IPD while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-kΩ resistor can be used to compliment the IPU/IPD on the boot and configuration pins while meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

For most systems, a 20-kΩ resistor can also be used as an external PU/PD on the pins that have IPUs/IPDs disabled and require an external PU/PD resistor while still meeting the above criteria. Users should confirm this resistor value is correct for their specific application.

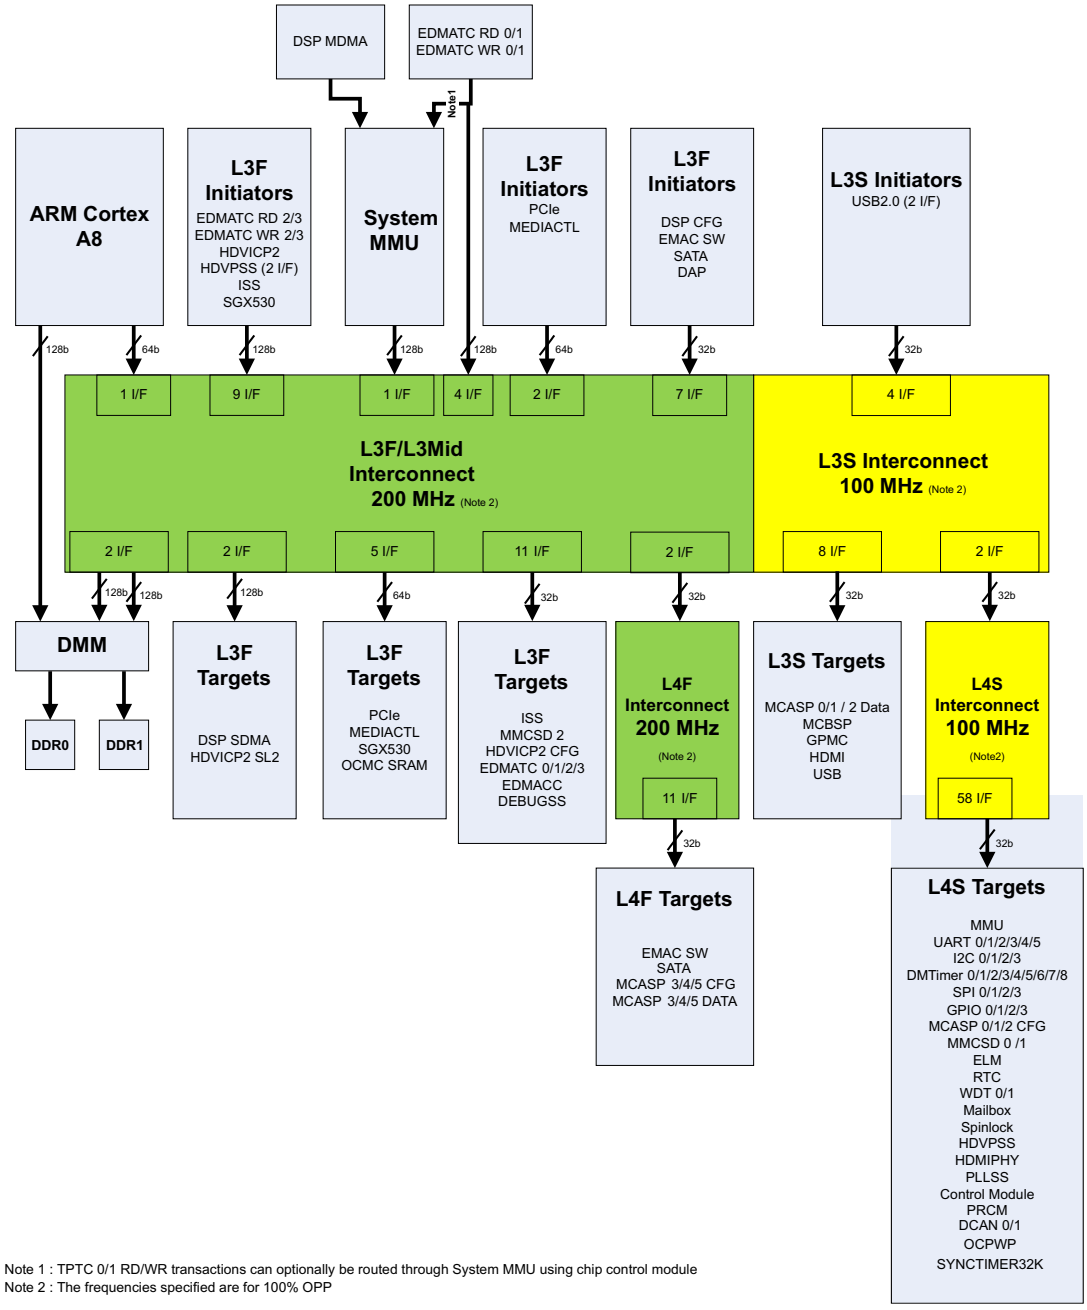
For more detailed information on input current (I_I), and the low-/high-level input voltages (V_{IL} and V_{IH}) for the device, see Section 6.4, *Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature*.

For the internal pullup/pulldown resistors for all device pins, see the peripheral/system-specific terminal functions table.

5 System Interconnect

The device's various processors, subsystems, and peripherals are interconnected through a switch fabric architecture. The switch fabric is composed of an L3 and L4 interconnect, a switched central resource (SCR), and multiple bridges (for an overview, see Figure 5-1). Not all Initiators in the switch fabric are connected to all Target peripherals. The supported initiator and target connections are designated by a "X" in Table 5-1, *Target/Initiator Connectivity*.

For more detailed information on the device System Interconnect Architecture, see the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).



Note 1 : TPTC 0/1 RD/WR transactions can optionally be routed through System MMU using chip control module
Note 2 : The frequencies specified are for 100% OPP

The L4 interconnect is a non-blocking peripheral interconnect that provides low-latency access to a large number of low-bandwidth, physically-dispersed target cores. The L4 can handle incoming traffic from up to four initiators and can distribute those communication requests to and collect related responses from up to 63 targets.

The device provides two interfaces with L3 interconnect for high-speed peripheraland standard peripheral.

	I/O, 1.8 V (DVDD_M, DVDD_DDR[0], DVDD_DDR[1], VDDA_1P8, VDDA_ARMPLL_1P8, VDDA_DSPPLL_1P8, VDDA_VID0PLL_1P8, VDDA_VID1PLL_1P8, VDDA_AUDIOPLL_1P8, VDDA_DDRPLL_1P8, VDDA_L3PLL_1P8, VDDA_PCIE_1P8, VDDA_SATA_1P8, VDDA_HDMI_1P8, VDDA_USB0_1P8, VDDA_USB1_1P8, VDDA_VDAC_1P8)	-0.3 V to 2.1 V
	I/O 3.3 V (DVDD, DVDD_GPMC, DVDD_GPMCB, DVDD_SD, DVDD_C)	-0.3 V to 4.0 V
	DDR Reference Voltage (VREFSSTL_DDR[0], VREFSSTL_DDR[1])	-0.3 V to 1.1 V
Input and Output voltage ranges:	V I/O, 1.5-V pins (Steady State)	-0.3 V to DVDD_DDR[x] + 0.3 V
	V I/O, 1.8-V pins (Steady State)	-0.3 V to DVDD + 0.3 V -0.3 V to DVDD_x + 0.3 V
	V I/O, 3.3-V pins (Steady State)	-0.3 V to DVDD + 0.3 V -0.3 V to DVDD_x + 0.3 V
Operating junction temperature range, T_J:	Commercial Temperature	0°C to 90°C
	Industrial	-40°C to 90°C
	Extended	-40°C to 105°C
Storage temperature range, T_{stg}:		-55°C to 150°C
Latch-up Performance:	I-test: Silicon Revision 3.0, All I/O pins (3)	±100 mA
	I-test: Silicon Revision 2.1, All I/O pins (3)	±70 mA
	Over-Voltage Test, All Supply pins (4)	1.5xVddmax V
Electrostatic Discharge (ESD) Performance:	ESD-HBM (Human Body Model) (5)	±1000 V
	ESD-CDM (Charged-Device Model) (6)	±250 V

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to their associated VSS or VSSA_x.
(3) Pins stressed per JEDEC JESD78 at 90°C (Class II) and passed with specified I/O pin injection current and clamp voltage of 1.5 times maximum recommended I/O voltage and negative 0.5 times maximum recommended I/O voltage.
(4) Supplies stressed per JEDEC JESD78 at 90°C (Class II) and passed specified voltage injection.
(5) Level listed is the passing level per ANSI/ESDA/JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 500-V HBM is possible if necessary precautions are taken. Pins listed as 1000 V may actually have higher performance.
(6) Level listed is the passing level per EIA-JEDEC JESD22-C101E. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process, and manufacturing with less than 250-V CDM is possible if necessary precautions are taken. Pins listed as 250 V may actually have higher performance.

6.2 Recommended Operating Conditions

PARAMETER			MIN	NOM	MAX	UNIT
CVDD	Supply voltage, Core (Scalable) DVFS only, No AVS	166% OPP	1.28	1.35	1.42	V
		120% OPP	1.14	1.20	1.26	
		100% OPP	1.05	1.10	1.16	
CVDD_ARM	Supply voltage, Core ARM (Scalable) DVFS only, No AVS	166% OPP	1.28	1.35	1.42	V
		120% OPP	1.14	1.20	1.26	
		100% OPP	1.05	1.10	1.16	
CVDD_DSP	Supply voltage, Core, DSP (Scalable) DVFS only, No AVS	166% OPP	1.28	1.35	1.42	V
		120% OPP	1.14	1.20	1.26	
		100% OPP	1.05	1.10	1.16	
CVDD_HDVICP	Supply voltage, Core, HDVICP2 (Scalable) DVFS only, No AVS	166% OPP	1.28	1.35	1.42	V
		120% OPP	1.14	1.20	1.26	
		100% OPP	1.05	1.10	1.16	
DVDD	Supply voltage, I/O, standard pins(1)	3.3 V	3.14	3.3	3.47	V
		1.8 V	1.71	1.8	1.89	
DVDD_GPMC	Supply voltage, I/O, GPMC pin group	3.3 V	3.14	3.3	3.47	V
		1.8 V	1.71	1.8	1.89	
DVDD_GPMCB	Supply voltage, I/O, GPMCB pin group	3.3 V	3.14	3.3	3.47	V
		1.8 V	1.71	1.8	1.89	
DVDD_SD	Supply voltage, I/O, SD pin group	3.3 V	3.14	3.3	3.47	V
		1.8 V	1.71	1.8	1.89	
DVDD_C	Supply voltage, I/O, C pin group	3.3 V	3.14	3.3	3.47	V
		1.8 V	1.71	1.8	1.89	
DVDD_M	Supply voltage, I/O, M pin group	1.8 V	1.71	1.8	1.89	V
DVDD_DDR[0] DVDD_DDR[1]	Supply voltage, I/O, DDR[0] and DDR[1]	DDR2	1.71	1.8	1.89	V
		DDR3 mode	1.43	1.5	1.58	
VDDA_USB_3P3	Supply voltage, I/O, Analog, USB 3.3 V		3.14	3.3	3.47	V
VDDA_1P8 VDDA_x_1P8	Supply Voltage, I/O, Analog, (VDDA_1P8, VDDA_ARMPLL_1P8, VDDA_DSPPLL_1P8, VDDA_VID0PLL_1P8, VDDA_VID1PLL_1P8, VDDA_AUDIOPLL_1P8, VDDA_DDRPLL_1P8, VDDA_L3PLL_1P8, VDDA_PCIE_1P8, VDDA_SATA_1P8, VDDA_HDMI_1P8, VDDA_USB0_1P8, VDDA_USB1_1P8, VDDA_VDAC_1P8) **Note:** HDMI, USB0/1, and VDAC relative to their respective VSSA.		1.71	1.8	1.89	V
VSS	Supply Ground (VSS, VSSA_HDMI, VSSA_USB, VSSA_VDAC, VSSA_DEVOSC(2), VSSA_AUXOSC(2))			0		V
$V_{REFSSTL\_DDR[x]}$	IO Reference Voltage, (VREFSSTL_DDR[0], VREFSSTL_DDR[1])		0.49 * DVDD_DDR[x]	0.50 * DVDD_DDR[x]	0.51 * DVDD_DDR[x]	V
USBx_VBUSIN	USBx VBUS Comparator Input		4.75	5	5.25	V
V_{IH}	High-level input voltage, LVCMOS (JTAG[TCK] pins), 3.3 V(1)		2			V
	High-level input voltage, JTAG[TCK], 3.3 V		2.15			V
	High-level input voltage, JTAG[TCK], 1.8 V		1.45			V
	High-level input voltage, I2C (I2C[0] and I2C[1])		0.7DVDD			V
	High-level input voltage, LVCMOS(1), 1.8 V		0.65DVDDx			V

(1) LVCMOS pins are all I/O pins powered by DVDD, DVDD_GPMC, DVDD_GPMCB, DVDD_SD, DVDD_C supplies except for I2C[0] and I2C[1] pins.
(2) When using the internal Oscillators, the oscillator grounds (VSSA_DEVOSC, VSSA_AUXOSC) must be kept separate from other grounds and connected directly to the crystal load capacitor ground.

Recommended Operating Conditions *(continued)*

PARAMETER			MIN	NOM	MAX	UNIT
V_{IL}	Low-level input voltage, LVCMOS(1), 3.3 V				0.8	V
	Low-level input voltage, JTAG[TCK]				0.45	V
	Low-level input voltage, I2C (I2C[0] and I2C[1])				0.3DVDDx	V
	Low-level input voltage, LVCMOS(1), 1.8 V				0.35DVDDx	V
I_{OH}	High-level output current	6 mA I/O buffers			-6	mA
		DDR[0], DDR[1] buffers @ 50-Ω impedance setting			-8	mA
I_{OL}	Low-level output current	6 mA I/O buffers			6	mA
		DDR[0], DDR[1] buffers @ 50-Ω impedance setting			8	mA
V_{ID}	Differential input voltage (SERDES_CLKN/P), [AC coupled]		0.250		2.0	V
t_t	Transition time, 10% - 90%, All inputs (unless otherwise specified in the *Electrical Data/Timing* sections of each peripheral)				0.25P or 10(3)	ns
T_J	Operating junction temperature range(4)	Commercial Temperature (default)	0		90	°C
		Industrial	-40		90	°C
		Extended	-40		105	°C

(3) Whichever is smaller. P = the period of the applied signal. Maintaining transition times as fast as possible is recommended to improve noise immunity on input signals.
(4) For more detailed information on estimating junction temps within systems, see the *IC Package Thermal Metrics* Application Report (Literature Number: SPRA953).

6.3 Power-On Hours (POH)

The POH information in Table 6-1 is provided solely for convenience and does not extend or modify the warranty provided under TI's standard terms and conditions for TI Semiconductor Products. To avoid significant device degradation, the device POH must be limited to those shown in Table 6-1.

Table 6-1. Power-On Hour Limits

Operating Condition	Nominal CVDD Voltage (V)	Junction Temperature (T_j)	Lifetime POH(1)
100% OPP	1.1	-40 to 105 °C	100K
120% OPP	1.2	-40 to 105 °C	100K
166% OPP	1.35	-40 to 105 °C	49K

(1) POH represent device operation under the specified nominal conditions continuously for the duration of the calculated lifetime.

Logic functions and parameter values are not ensured out of the range specified in Section 6.2, Recommended Operating Conditions.

The above notations cannot be deemed a warranty or deemed to extend or modify the warranty under TI's standard terms and conditions for semiconductor products.

6.4 Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted)

PARAMETER		TEST CONDITIONS(1)	MIN	TYP	MAX	UNIT
V_{OH}	Low/Full speed: USB_DM and USB_DP		2.8		VDD_USB_3P3	V
	High speed: USB_DM and USB_DP		360		440	mV
	High-level output voltage, LVCMOS(2) (3.3-V I/O)	3.3 V, DVDDx = MIN, I_{OH} = MAX	2.4			V
	High-level output voltage, LVCMOS(2) (1.8-V I/O)	1.8 V, DVDDx = MIN, I_{OH} = MAX	1.26			V
V_{OL}	Low/Full speed: USB_DM and USB_DP		0.0		0.3	V
	High speed: USB_DM and USB_DP		-10		10	mV
	Low-level output voltage, LVCMOS(2) (3.3-V I/O)	3.3 V, DVDDx = MAX, I_{OL} = MAX			0.4	V
	Low-level output voltage, LVCMOS(2) (1.8-V I/O)	1.8 V, DVDDx = MAX, I_{OL} = MAX			0.4	V
	Low-level output voltage, I2C (I2C[0], I2C[1])	1.8/3.3 V, I_{OL} = 4mA			0.4	V
	LDOs (applies to all LDOCAP_x pins)				1.5	V
I_I(3)	Input current, LVCMOS(2), 3.3 V mode	0 < V_I < DVDDx, 3.3 V pull disabled	-20		20	µA
		0 < V_I < DVDDx, 3.3 V pulldown enabled(4)	20	100	300	µA
		0 < V_I < DVDDx, 3.3 V pullup enabled(4)	-20	-100	-300	µA
	Input current, LVCMOS(2), 1.8 V mode	0 < V_I < DVDDx, 1.8 V pull disabled	-5		5	µA
		0 < V_I < DVDDx, 1.8 V pulldown enabled(4)	50	100	200	µA
		0 < V_I < DVDDx, 1.8 V pullup enabled(4)	-50	-100	-200	µA
	Input current, I2C (I2C[0], I2C[1])	3.3 V mode	-20		20	µA
		1.8 V mode	-5		5	µA
I_{OZ}(5)	I/O Off-state output current	3.3 V mode, pull enabled	-300		300	µA
		3.3 V mode, pull disabled	-20		20	µA
		1.8 V mode, pull enabled	-200		200	µA
		1.8 V mode, pull disabled	-5		5	µA
I_{CDD}	Core (CVDD) supply current (scalable)		see note (6)			mA
ICVDD_ARM	ARM Core Current (Scalable)		see note (6)			mA
ICVDD_DSP	DSP Core Current (Scalable)		see note (6)			mA
ICVDD_HDVICP	HDVICP2 Core Current (Scalable)		see note (6)			mA

(1) For test conditions shown as MIN, MAX, or TYP, use the appropriate value specified in the recommended operating conditions table.
(2) LVCMOS pins are all I/O pins powered by DVDD, DVDD_GPMC, DVDD_GPMCB, DVDD_SD, DVDD_C supplies except for I2C[0] and I2C[1] pins.
(3) I_I applies to input-only pins and bi-directional pins. For input-only pins, I_I indicates the input leakage current. For bi-directional pins, I_I indicates the input leakage current and off-state (Hi-Z) output leakage current.
(4) Applies only to pins with an internal pullup (IPU) or pulldown (IPD) resistor.
(5) I_{OZ} applies to output-only pins, indicating off-state (Hi-Z) output leakage current.
(6) The actual current draw varies across manufacturing processes and is highly application-dependent. For more details on core and I/O activity, as well as information relevant to board power supply design, see the *TMS320DM814x/AM387x Power Estimation Spreadsheet* Application Report (Literature Number: SPRABO3). To determine the worst-case power consumption values, use the *TMS320DM814x/AM387x Power Estimation Spreadsheet* Application Report.

Electrical Characteristics Over Recommended Ranges of Supply Voltage and Operating Temperature (Unless Otherwise Noted) *(continued)*

PARAMETER		TEST CONDITIONS[1]	MIN	TYP	MAX	UNIT
I_{DDD}	3.3-V I/O (DVDD, DVDD_GPMC, DVDD_GPMCB, DVDD_SD, DVDD_C, VDDA_USB_3P3) supply current			see note [6]		mA
	1.8-V I/O (DVDD, DVDD_GPMC, DVDD_GPMCB, DVDD_SD, DVDD_C DVDD_M, DVDD_DDR[0], DVDD_DDR[1] [for DDR2], VDDA_x_1P8) supply current			see note [6]		mA
	1.5-V I/O (DVDD_DDR[0], DVDD_DDR[1] [for DDR3 SDRAM]) supply current			see note [6]		mA
C_I	Input capacitance LVCMOS[2]				12	pF
C_o	Output capacitance LVCMOS[2]				12	pF

7 Power, Reset, Clocking, and Interrupts

7.1 Power, Reset and Clock Management (PRCM) Module

The PRCM module is the centralized management module for the power, reset, and clock control signals of the device. The PRCM interfaces with all the components on the device for power, clock, and reset management through power-control signals. The PRCM module inTiming Requirements for AUD_CLKINxtegrates enhanced features to allow the device to adapt energy consumption dynamically, according to changing application and performance requirements. The innovative hardware architecture allows a substantial reduction in leakage current.

The PRCM module is composed of two main entities:

- Power reset manager (PRM): Handles the power, reset, wake-up management, and system clock source control (oscillator)
- Clock manager (CM): Handles the clock generation, distribution, and management.

For more details on the PRCM, see the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.2 Power

7.2.1 Voltage and Power Domains

Every Module within the device belongs to a Core Logic Voltage Domain, Memory Voltage Domain, and a Power Domain (see Table 7-1).

Table 7-1. Voltage and Power Domains

CORE LOGIC VOLTAGE DOMAIN	MEMORY VOLTAGE DOMAIN	POWER DOMAIN	MODULES
ARM_L	ARM_M	ALWAYS ON	ARM Cortex-A8 Subsystem
CORE_L	CORE_M		DCAN0/1, DMM, EDMA, ELM, DDR0/1, EMAC Switch, GPIO Banks 0/1/2/3,GPMC, I2C0/1/2/3, IPC, MCASP0/1/2/3/4/5, MCBSP, OCMC SRAM, PCIE, PRCM, RTC, SATA, SD/MMC0/1/2, SPI01/2/3, Timer1/2/3/4/5/6/7/8, UART0/1/2/3/4/5, USB0/1, WDT0, System Interconnect, JTAG, Media Controller, ISS
		GFX	SGX530
		HDVPSS	HDVPSS, HDMI, SD-DAC
DSP_L	DSP_M	DSP	C674x DSP and L2 SRAM
HDVICP_L	HDVICP_M	HDVICP	HDVICP2

7.2.1.1 Core Logic Voltage Domains

The device contains four Core Logic Voltage Domains. These domains define groups of Modules that share the same supply voltage for their core logic. Each Core Logic Voltage Domain is powered by a dedicated supply voltage rail. Table 7-2 shows the mapping between the Core Logic Voltage Domains and their associated supply pins.

Table 7-2. Core Logic Voltage Domains and Supply Pin Associations

CORE LOGIC VOLTAGE DOMAIN	SUPPLY PIN NAME
ARM_L	CVDD_ARM
CORE_L	CVDD
DSP_L	CVDD_DSP
HDVICP_L	CVDD_HDVICP

Note: A regulated supply voltage ***must*** be supplied to each Core Logic Voltage Domain at all times, regardless of the Core Logic Power Domain states.

7.2.1.2 Memory Voltage Domains

The SRAM within each Device Module is assigned to one of four Memory Voltage Domains. The voltage of each Memory Voltage Domain is independently controlled by internal LDO regulators, which are supplied by the VDDA_1P8 pins.

The voltage level output by each of these LDO regulators is controlled through software by programming the RAMLDO_CTRLx registers in the Control Module. The Memory Voltage Domain voltage must be programmed based on the Core Logic Voltage Domain voltage for that domain (that is, the corresponding Core Logic Voltage Domain for the ARM_M Voltage Domain is ARM_C, and so on). Table 7-3 shows the Memory Voltage Domain voltage requirements.

Table 7-3. Memory Voltage Domain LDO Requirements

CORE LOGIC VOLTAGE DOMAIN VOLTAGE (V)	MEMORY VOLTAGE DOMAIN VOLTAGE (V)
0.83 – 1.20	1.20

7.2.1.3 Power Domains

The device contains six Power Domains which supply power to both the Core Logic and SRAM within their associated modules. Each Power Domain, except for the ALWAYS ON domain, has an internal power switch that can completely remove power from that domain. All power switches are turned "OFF" by default after reset, and software can individually turn them "ON/OFF" via Control Module registers.

Note: All Modules within a Power Domain are unavailable when the domain is powered "OFF". For instructions on powering "ON/OFF" the Power domains, see the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.2.2 SmartReflex [Not Supported]

The device contains SmartReflex modules that help to minimize power consumption on the Core Logic Voltage Domains by using external variable-voltage power supplies. Based on the device process, temperature, and desired performance, the SmartReflex modules advise the host processor to raise or lower the supply voltage to each domain for minimal power consumption.

The communication link between the host processor and the external regulators is a system-level decision and can be accomplished using GPIOs, I2C, SPI, or other methods. The following sections briefly describe the two major techniques employed by SmartReflex: Dynamic Voltage Frequency Scaling (DVFS) and Adaptive Voltage Scaling (AVS).

7.2.2.1 Dynamic Voltage Frequency Scaling (DVFS)

Each device Core Logic Voltage Domain can be run independently at one of several Operating Performance Points (OPPs). An OPP for a specific Core Logic Voltage Domain is defined by: (1) maximum frequencies of operation for Modules within the Domain and (2) an associated supply voltage range. Trading off power versus performance, OPPs with lower maximum frequencies also have lower voltage ranges for power savings.

The OPP for a domain can be changed in real-time without requiring a reset. This feature is called Dynamic Voltage Frequency Scaling (DVFS). Table 7-4 contains a list of voltage ranges and maximum module frequencies for the OPPs of each Core Logic Voltage Domain.

Table 7-4. Device Operating Points (OPPs)

OPP	CORE LOGIC VOLTAGE DOMAINS								
	ARM	DSP	HDVICP	CORE					
	Cortex A8 (MHz)	DSP (MHz)	HDVICP2 (MHz)	HDVPSS (MHz)	SGX (MHz)	ISS (MHz)	Media Ctlr. (MHz)	L3/L4, Core (MHz)	DDR (MHz)(1)
100% (1.1 V)	600	500	266	200	200	400	200	200	400
120% (1.2 V)	720	600	306	200	250	400	200	220	400
166% (CYE1) (1.35 V)	1000	700 750(2)	410	220	280	480	240	220	533
166% (CYE2) (1.35 V)	1000	750	450	220	280	560	280	220	533

(1) All DDR access ***must*** be suspended prior to changing the DDR frequency of operation.
(2) Only DM814x SR3.0 devices support a DSP Frequency of 750-MHz. For more details on device silicon revisions, see Figure 9-1, *Device Nomenclature*.

Although the OPP for each Core Logic Voltage Domain is independently selectable, not all combinations of OPPs are supported. Table 7-5 marks the supported ARM, DSP, and HDVICP2 OPPs for a given CORE OPP.

Table 7-5. Supported OPP Combinations(1)(2)

CORE	ARM			DSP			HDVICP2		
	OPP166	OPP120	OPP100	OPP166	OPP120	OPP100	OPP166	OPP120	OPP100
OPP166	X			X			X		
OPP120	X	X		X	X		X	X	
OPP100		X	X		X	X		X	X

(1) "X" denotes supported combinations.
(2) The maximum voltage differences between CVDD and any other CVDD_x voltage domain **must** be < 150 mV.

7.2.2.2 Adaptive Voltage Scaling [Not Supported]

As mentioned in Section 7.2.2.1, *Dynamic Voltage Frequency Scaling (DVFS)* above, every OPP has an associated voltage range. Based on the silicon process, temperature, and chosen OPP, the SmartReflex modules guide software in adjusting the Core Logic Voltage Domain supply voltages within these ranges. This technique is called Adaptive Voltage Scaling (AVS). AVS occurs continuously and in real-time, helping to minimize power consumption in response to changing operating conditions.

7.2.3 Memory Power Management

To reduce SRAM leakage, many SRAM blocks can be switched from ACTIVE mode to SHUTDOWN mode. When SRAM is put in SHUTDOWN mode, the voltage supplied to it is automatically removed and all data in that SRAM is lost.

All SRAM located in a switchable power domain (all domains except ALWAYS_ON) automatically enters SHUTDOWN mode whenever its associated power domain goes into the "OFF" state. The SRAM returns to the ACTIVE state when the corresponding Power Domain returns to the "ON" state.

In addition, the following SRAM within the ALWAYS_ON Power Domain can also be independently put into SHUTDOWN by programming the x_MEM_PWRDN registers in the Control Module:

- Media Controller SRAM
- OCMC SRAM

For detailed instructions on powering up/down the various device SRAM, see the *Control Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.2.4 SERDES_CLKP and SERDES_CLKN LDO

The SERDES_CLKP and SERDES_CLKN input buffers are powered by an internal LDO which is programmed through the REFCLK_LJCBLDO_CTRL register in the Control Module.

For more information on programming the SERDES_CLKP and SERDES_CLKN LDO, see *PCI Express (PCIe) Module* and *Serial ATA (SATA) Controller* chapters of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.2.5 Dual Voltage I/Os

The device supports dual voltages on some of its I/Os. These I/Os are partitioned into the following groups, and each group has its own dedicated supply pins: DVDD, DVDD_GPMC, DVDD_C, and DVDD_SD. The supply voltage for each group can be independently powered with either 1.8 V or 3.3 V.

For the mapping between pins and power groups, see Section 3.2, *Terminal Functions* of the datasheet.

In addition, the I/O voltage on each DDR interface is independently selectable between either 1.5 V or 1.8 V to support various DDR device types. The I/O supplies for each DDR interface are separate and isolated to allow populating different memory types on each interface.

7.2.6 I/O Power-Down Modes

On the device, there are power-down modes available for the following PHYs:

- Video DAC
- DDR
- USB
- HDMI
- PCIE
- SATA

When a PHY controller is in a power domain that is to be turned "OFF", software must configure the corresponding PHY into power-down mode, prior to putting the power domain in the "OFF" state.

7.2.7 Standby Mode

The device supports Low-Power Standby Mode as described below.

Standby Mode is defined as a state in which:

- All switchable power domains are in "OFF" state
- The ARM Cortex-A8 is executing an IDLE loop at its lowest frequency of operation
- All functional blocks not needed for a given application are clock gated

For detailed instructions on entering and exiting from Standby Mode see the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.2.8 Supply Sequencing

The device power supplies are organized into four Supply Sequencing Groups:

1. All CVDD supplies (CVDD, CVDD_x)
2. All 1.5-/1.8-V DVDD_DDR[x] Supplies (1.5 V for DDR3, 1.8 V for DDR2)
3. All 1.8-V Supplies (DVDD_x, DVDD_M, VDDA_x_1P8, VDDA_1P8)
4. All 3.3-V Supplies (DVDD, DVDD_x, DVDD_C, VDDA_x_3P3)

To ensure proper device operation, a specific power-up and power-down sequence must be followed. Some TI power-supply devices include features that facilitate these power sequencing requirements — for example, TI's TPS659113 integrated PMIC. For more information on TI power supplies and their features, visit www.ti.com/processorpower.

For more detailed information on the actual power supply names and their descriptions, see Table 3-49, *Supply Voltages Terminal Functions*.

7.2.8.1 Power-Up Sequence

For proper device operation, the following power-up sequence in Table 7-6 and ***must*** be followed.

Table 7-6. Power-Up Sequence Ramping Values

NO.	DESCRIPTION	MIN	MAX	UNIT
1	1.8 V and DVDD_DDR[x] supplies stable to 3.3 V supplies ramp start	0		ms
2	1.8 V supplies to 1.5-/1.8- V DVDD_DDR[x] supplies	0(1)		ms
3	1.8 V supplies stable to CVDD, CVDD_x variable supplies ramp start	0(1)		ms
13	CVDD variable supply ramp start to CVDD_x variable supplies ramp start	0		ms
4	All supplies valid to power-on-reset ($\overline{\text{POR}}$ high)	4 096		Master Clocks

(1) The 1.8 V supplies ***must*** be ≥ 1.5-/1.8-V DVDD_DDR[x] supplies.

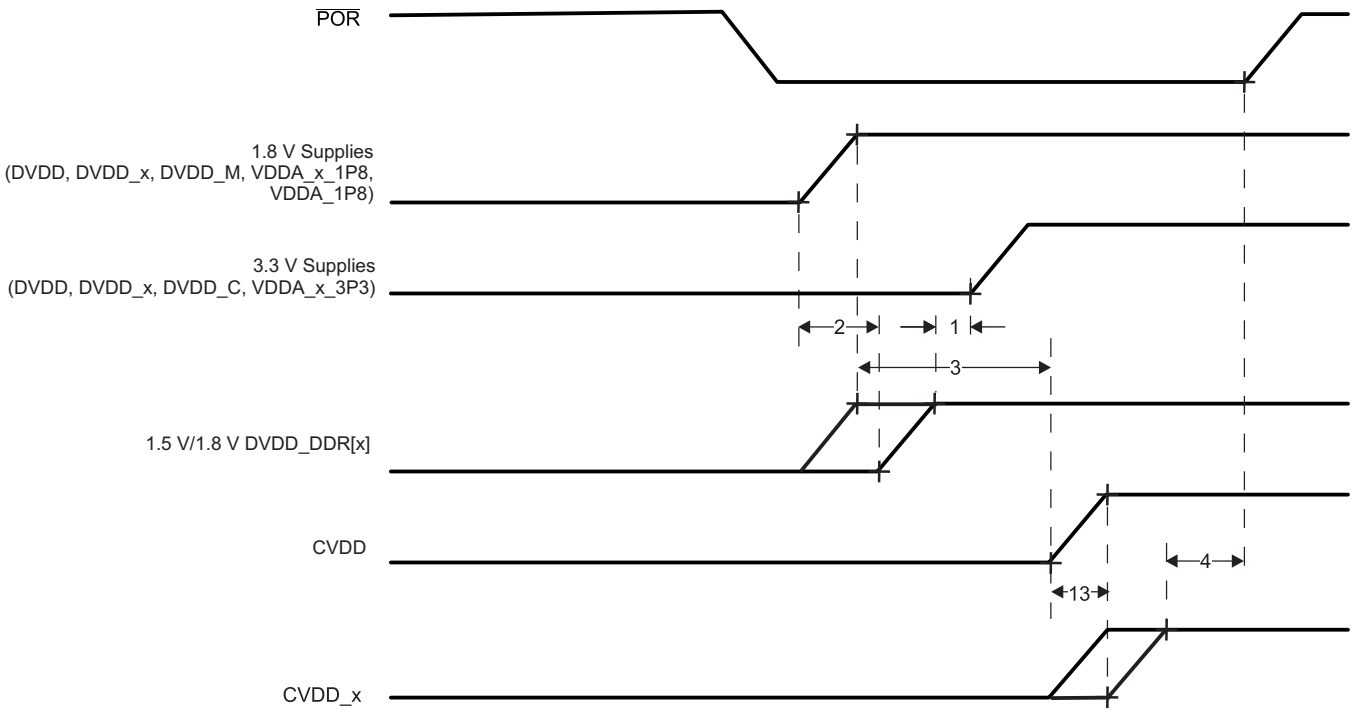

Figure 7-1. Power-Up Sequence

7.2.8.2 Power-Down Sequence

For proper device operation, the following power-down sequence in Table 7-7 and Figure 7-2 ***must*** be followed. Ramping down all supplies at the same time is allowed, provided the requirements in Table 7-7 are met.

Table 7-7. Power-Down Sequence Ramping Values

NO.	DESCRIPTION	MIN	MAX	UNIT
8	CVDD, CVDD_x variable supply to 1.8 V supplies	See (1)	See (1)	ms
9	1.5-/1.8-V DVDD_DDR[x] supplies to 1.8 V supplies	See (1)	See (1)	ms
10	3.3 V supplies to 1.8 V supplies	See (2)	See (2)	ms
14	CVDD_x variable supplies ramp-down start to CVDD variable supply ramp-down start	0		ms

(1) The 1.5-/1.8-V DVDD_DDR[x] and CVDD, CVDD_x variable supplies can be powered down prior to or simultaneously with the 1.8-V supplies.
(2) The 3.3 V supplies ***must*** never be more than 2 V above the 1.8 V supplies (see Figure 7-3).

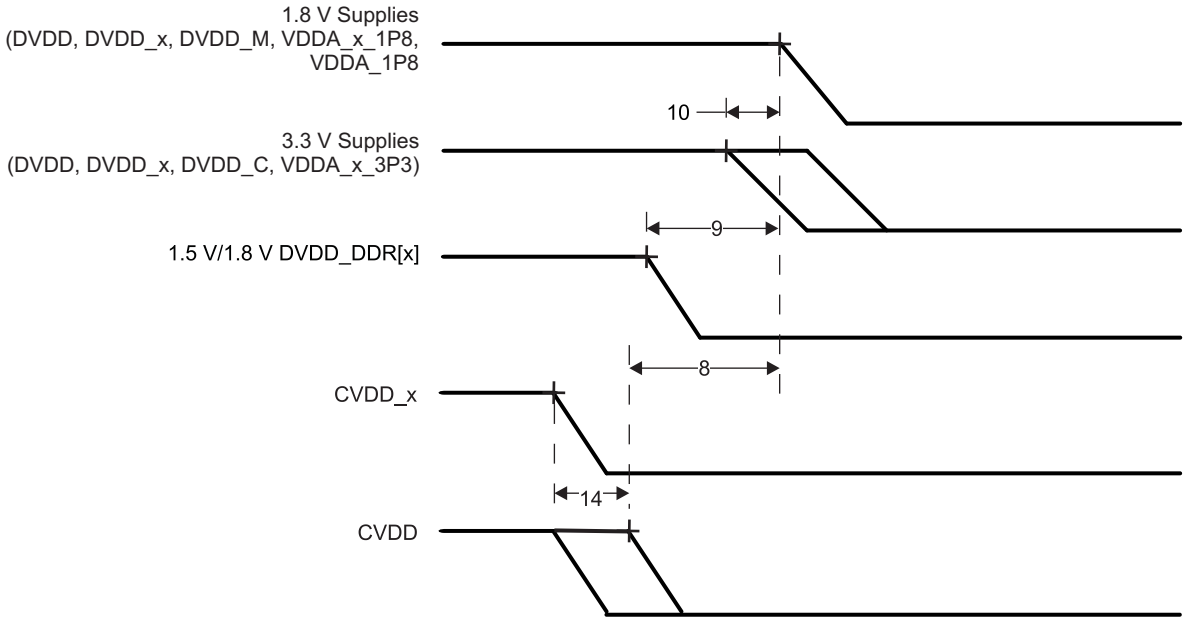

Figure 7-2. Power-Down Sequence

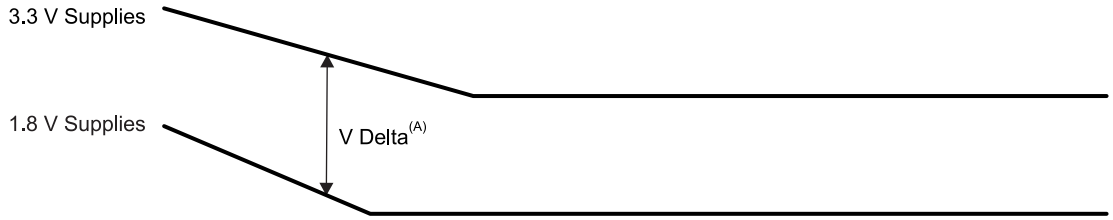

Figure 7-3. 1.8 V Supplies Falling Before 3.3 V Supplies Delta

7.2.9 Power-Supply Decoupling

7.2.9.1 Analog and PLL

PLL and Analog supplies benefit from filters or ferrite beads to keep the noise from causing problems. The minimum recommendation is a ferrite bead along with at least one capacitor on the device side of the bead. An additional recommendation is to add one capacitor just before the bead to form a Pi filter. The filter needs to be as close as possible to the device pin, with the device side capacitor being the most important component to be close to the device pin. PLL pins close together can be combined on the same supply, but analog pins should all have their own filters. PLL pins farther away from each other may need their own filtered supply.

7.2.9.2 Digital

Recommended capacitors for power supply decoupling are all 0.1uF in the smallest body size that can be used. Capacitors are more effective in the smallest physical size to limit lead inductance. For example, 0201 sized capacitors are better than 0402 sized capacitors, and so on. TI recommends using capacitors no larger than 0402. Place at least one capacitor for every two power pins. For those power pins that have only one pin, a capacitor is still required. Place one bulk (10 uF or larger) capacitor for every 10 or so power pins as closely as possible to the chip. These larger caps do not need to be under the chip footprint.

Pay special attention not to put so much capacitance on the supply that it slows the start-up voltage ramp enough to change the power sequencing order. Also be sure to verify that the main chip reset is low until after all supplies are at their correct voltage and stable.

DDR peripheral related supply capacitor numbers are provided in Section 8.13, *DDR2/DDR3 Memory Controller*.

7.3 Reset

7.3.1 System-Level Reset Sources

The device has several types of system-level resets. Table 7-8 lists these reset types, along with the reset initiator, and the effects of each reset on the device.

Table 7-8. System-Level Reset Types

TYPE	INITIATOR	RESETS ALL MODULES, EXCLUDING EMAC SWITCH, EMULATION, PLL AND CLOCK CONFIG	RESETS EMAC SWITCH	RESETS EMULATION	PLL AND CLOCK CONFIG	LATCHES BOOT PINS	ASSERTS RSTOUT_WD_OUT PIN
Power-on Reset (POR)	POR pin	Yes	Yes	Yes	Yes	Yes	Optional(1)(2)
External Warm Reset	RESET pin	Yes	Optional(3)	No	No	Yes	Optional(1)(2)
Emulation Warm Reset	On-Chip Emulation Logic	Yes	Optional(3)	No	No	No	Optional(1)
Watchdog Reset	Watchdog Timer	Yes	Optional(3)	No	No	No	Yes
Software Global Cold Reset	Software	Yes	Optional(3)	Yes	Yes	No	Optional(1)
Software Global Warm Reset	Software	Yes	Optional(3)	No	No	No	Optional(1)
Test Reset	TRST pin	No	No	Yes	No	No	No

(1) RSTOUT_WD_OUT pin asserted only if BTMODE[11] was latched as "0" when coming out of reset.
(2) While POR and/or RESET is asserted, the RSTOUT_WD_OUT pin is 3-stated and the internal pull resistor is disabled; therefore, an external pullup/pulldown can be used to set the state of this pin (high/low) while POR and/or RESET is asserted. For more detailed information on external PUs/PDs, see Section 4.5.1, *Pullup/Pulldown Resistors*.
(3) EMAC Switch is NOT reset when the ISO_CONTROL bit in the RESET_ISO Control Module register is set to "1".

7.3.2 Power-on Reset (POR pin)

Power-on Reset (POR) is initiated by the POR pin and is used to reset the entire chip, including the Test and Emulation logic, and the EMAC Switch. POR is also referred to as a cold reset since it is required to be asserted when the device goes through a power-up cycle. However, a device power-up cycle is not required to initiate a Power-on Reset.

The following sequence ***must*** be followed during a Power-on Reset:

1. Wait for the power supplies to reach normal operating conditions while keeping the POR pin asserted.
2. Wait for the input clock sources DEV_CLKIN, AUX_CLKIN, and SERDES_CLKN/P to be stable (if used by the system) while keeping the POR pin asserted (low).
3. Once the power supplies and the input clock sources are stable, the POR pin must remain asserted (low) [see Section 7.3.18, *Reset Electrical Data/Timing*]. Within the low period of the POR pin, the following happens:
   (a) All pins except Emulation pins enter a Hi-Z mode and the associated pulls, if applicable, will be enabled.
   (b) The PRCM asserts reset to all modules within the device.
   (c) The PRCM begins propagating these clocks to the chip with the PLLs in BYPASS mode.
4. The POR pin may now be de-asserted (driven high). When the POR pin is de-asserted (high):
   (a) The BTMODE[15:0] pins are latched.
   (b) Reset to the ARM Cortex-A8 and Modules without a local processor is de-asserted.
   (c) RSTOUT_WD_OUT is briefly asserted if BTMODE[11] was latched as "0".
   (d) The clock, reset, and power-down state of each peripheral is determined by the default settings of the PRCM.
   (e) The ARM Cortex-A8 begins executing from the Boot ROM.

7.3.3 External Warm Reset (RESET pin)

An external warm reset is activated by driving the RESET pin active-low. This resets everything in the device, except for the Test and Emulation logic, and the EMAC Switch (optional). An emulator session stays alive during warm reset.

The following sequence ***must*** be followed during a warm reset:

1. Power supplies and input clock sources should already be stable.
2. The RESET pin must be asserted (low)[see Section 7.3.18, *Reset Electrical Data/Timing*]. Within the low period of the RESET pin, the following happens:
   (a) All pins, except Test and Emulation pins, enter a Hi-Z mode and the associated pulls, if applicable, will be enabled.
   (b) The PRCM asserts reset to all modules within the device, except for the Test and Emulation logic, EMAC Switch (optional), PLL, and Clock configuration.
3. The RESET pin may now be de-asserted (driven high). When the RESET pin is de-asserted (high):
   (a) The BTMODE[15:0] pins are latched.
   (b) Reset to the ARM Cortex-A8 and modules without a local processor is de-asserted, with the exception of Test and Emulation logic, EMAC Switch (optional), PLL, and Clock configuration.
   (c) RSTOUT_WD_OUT is asserted [see Section 7.3.18, *Reset Electrical Data/Timing*], if BTMODE[11] was latched as "0".
   (d) The clock, reset, and power-down state of each peripheral is determined by the default settings of the PRCM.
   (e) The ARM Cortex-A8 begins executing from the Boot ROM.

7.3.4 Emulation Warm Reset

An Emulation Warm Reset is activated by the on-chip Emulation Module and has the same effect and requirements as an External Warm Reset (RESET), with the following exceptions:

- BTMODE[15:0] pins are not re-latched
- RSTOUT_WD_OUT is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

The emulator initiates an Emulation Warm Reset via the ICEPICK module. To invoke the Emulation Warm Reset via the ICEPICK module, the user can perform the following from the Code Composer Studio™ IDE menu: Target -> Reset -> System Reset.

7.3.5 Watchdog Reset

A Watchdog Reset is initiated when the Watchdog Timer counter reaches zero and has the same effect and requirements as an External Warm Reset (RESET pin), with the following exceptions:

- BTMODE[15:0] pins are not re-latched
- RSTOUT_WD_OUT is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

In addition, a Watchdog Reset always results in RSTOUT_WD_OUT being asserted, regardless of whether the BTMODE[11] pin was latched as "0" or "1".

7.3.6 Software Global Cold Reset

A Software Global Cold Reset is initiated under software control and has the same effect and requirements as a POR Reset, with the following exceptions:

- BTMODE[15:0] pins are not re-latched and EMAC Switch (optional) is not reset
- RSTOUT_WD_OUT is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

Software initiates a Software Global Cold Reset by writing a "1" to the RST_GLOBAL_COLD_SW bit in the PRM_RSTCTRL register in the PRCM.

For more detailed information on the PRM_RSTCTRL register, see the PRCM Registers section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.3.7 Software Global Warm Reset

A Software Global Warm Reset is initiated under software control and has the same effect and requirements as a External Warm Reset ($\overline{\text{RESET}}$ pin), with the following exceptions:

- BTMODE[15:0] pins are not re-latched
- $\overline{\text{RSTOUT\_WD\_OUT}}$ is not 3-stated and is actively driven based on the value previously latched on the BTMODE[11] pin.

Software initiates a Software Global Warm Reset by writing a "1" to the RST_GLOBAL_WARM_SW bit in the PRM_RSTCTRL register in the PRCM.

For more detailed information on the PRM_RSTCTRL register, see the PRCM Registers section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.3.8 Test Reset ($\overline{\text{TRST}}$ pin)

A Test Reset is activated by the emulator asserting the $\overline{\text{TRST}}$ pin. The only effect a Test Reset has is to reset the Test and Emulation Logic.

7.3.9 Local Reset

The Local Reset for various Modules within the device is controlled by programming the PRCM and/or the Peripheral Module's internal registers. Only the associated Module is reset when a Local Reset is asserted, leaving the rest of the device unaffected.

For more details on Peripheral Local Resets, see the Reset Management section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.3.10 Reset Priority

If any of the above reset sources occur simultaneously, the device only processes the highest-priority reset request. The reset request priorities, from high-to-low, are as follows:

1. Power-on Reset ($\overline{\text{POR}}$)
2. Test Reset ($\overline{\text{TRST}}$)
3. External Warm Reset ($\overline{\text{RESET}}$ pin)
4. Emulation Warm Resets
5. Watchdog Reset
6. Software Global Cold/Warm Resets

7.3.11 Reset Status Register

The Reset Status Register (PRM_RSTST) contains information about the last reset that occurred in the system. For more information on this register, see the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.3.12 PCIE Reset Isolation

The device supports reset isolation for the PCI Express (PCIE) module. This means that the PCI Express Subsystem can be reset without resetting the rest of the device.

When the devcie is a PCI Express Root Complex (RC), the PCIE Subsystem can be reset by software through the PRCM. Software should ensure that there are no ongoing PCIE transactions before asserting this reset by first taking the PCIE Subsystem into the IDLE state. After bringing the PCIE Subsystem out of reset, bus enumeration should be performed again and should treat all Endpoints (EP) as if they had just been connected.

When the device is a PCI Express Endpoint (EP), the PCIE Subsystem will generate an interrupt when an in-band reset is received. Software should process this interrupt by putting the PCIE Subsystem in the IDLE state and then asserting the PCIE local reset through the PRCM.

All device level resets mentioned in the previous sections, except Test Reset, will also reset the PCIE Subsystem. Therefore, the PCIE peripheral should issue a Hot Reset to all downstream devices and re-enumerate the bus upon coming out of reset.

For more detailed information on reset isolation procedures, see the PCIe Reset Isolation section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.3.13 EMAC Switch Reset Isolation

The device supports reset isolation for the Ethernet Switch (EMAC Switch). This allows the device to undergo all resets listed in Section 7.3.1, *System-Level Reset Sources*, with the exception of $\overline{\text{POR}}$ Reset, without disrupting the Ethernet Switch or the traffic being routed through the switch during the reset condition. The following reset types can optionally provide an EMAC Switch reset isolation by setting the ISO_CONTROL bit in the RESET_ISO Control Module register to a "1":

- External Warm Reset
- Emulation Warm Reset
- Watchdog Reset
- Software Global Cold Reset
- Software Global Warm Reset

When one of above resets occurs and the Ethernet Switch (EMAC Switch) is programmed to be isolated:

- The switch function of the EMAC Switch and the PLL embedded in the SATA SERDES Module (which provides the reference clocks to the EMAC Switch) will not be reset.
- Several Control Module registers are not reset. For more details, see the description of the RESET_ISO register in the *Control Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).
- The pin multiplexing of some of the EMAC Switch pins is unaffected. For more details, see the description of the RESET_ISO register in the *Control Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

The EMAC Switch is always reset when:

- One of the above resets occurs and the Ethernet Switch is programmed to be “not isolated”
- A $\overline{\text{POR}}$ Reset occurs

7.3.14 RSTOUT_WD_OUT Pin

The RSTOUT_WD_OUT pin reflects device reset status and is de-asserted (high) when the device is out reset. This output will always be asserted when a Watchdog Timer reset (Watchdog Reset) occurs. In addition, this output is always 3-stated and the internal pull resistor is disabled on this pin while POR and/or RESET is asserted; therefore, an external pullup/pulldown can be used to set the state of this pin (high/low) while POR and/or RESET is asserted. For more detailed information on external PUs/PDs, see Section 4.5.1, *Pullup/Pulldown Resistors*.

If the BTMODE[11] pin is latched as a "0" at the rising edge of POR or RESET, then RSTOUT_WD_OUT is also asserted when any of the below resets occur:

- Power-On Reset (asserted after the BTMODE[11] pin is latched)
- External Warm Reset (asserted after the BTMODE[11] pin is latched)
- Emulation Warm Reset
- Software Global Cold/Warm Reset

The RSTOUT_WD_OUT pin remains asserted until the PRCM releases the host ARM Cortex-A8 processor for reset.

7.3.15 Effect of Reset on Emulation and Trace

The device Emulation and Trace Logic will only be reset by the following sources:

- Power-On Reset
- Software Global Cold Reset
- Test Reset

Other than these three reset types, none of the other resets will affect the Emulation and Trace Logic. However, the multiplexing of the EMU[4:2] pins is reset by all system reset types except Test Reset.

7.3.16 Reset During Power Domain Switching

Each Power Domain has a dedicated Warm Reset and Cold Reset. Warm Reset for a Power Domain is asserted under either of the following two conditions:

1. An External Warm Reset, Emulation Warm Reset, or Software Global Warm Reset occurs
2. When that Power Domain switches from the "ON" state to the "OFF" state

Cold Reset for a Power Domain is asserted under either of the following two conditions:

1. Power-On Reset or Software Global Cold Reset occurs
2. When that Power Domain switches from the "OFF" state to the "ON" state

7.3.17 Pin Behaviors at Reset

When any reset, other than Test Reset, (all described in Section 7.3.1, *System-Level Reset Sources*) is asserted, all device I/O pins are reset into a Hi-Z state except for:

- Emulation Pins. These pins are only put into a Hi-Z state when Test Reset (TRST) is asserted.
- EMAC Switch Pins. These pins are always put into a Hi-Z state during Power-On Reset. However, some EMAC Switch pins will ***not*** be put into a Hi-Z state during the other reset modes when the ISO_CONTROL bit in the RESET_ISO register of the Control Module is programmed as a "1". For more details, see the description of the RESET_ISO register in the *Control Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).
- RSTOUT_WD_OUT Pin during any reset types except for POR and RESET. For more detailed information on RSTOUT_WD_OUT pin behavior, see Section 7.3.14, *RSTOUT_WD_OUT Pin*.

- DDR[0]/[1] Address/Control Pins (CLK, $\overline{CLK}$, CKE, $\overline{WE}$, $\overline{CS[1]}/[0]$, $\overline{RAS}$, $\overline{CAS}$, $\overline{ODT[1]}/[0]$, RST, BA[2:0], A[14:0]). These pins are 3-stated during reset. However, these pins are then driven to the same value as their internal pull resistor reset value when reset is released (For the direction of the internal pull during reset, see the DDR[0]/[1] Terminal Functions tables in the Section 3.2.4, *DDR2/DDR3 Memory Controller* of this document).

In addition, the PINCNTL registers, which control pin multiplexing, enabling the IPUs/IPDs, and enabling the receiver, are reset to their default state. Again, enabling the EMAC Switch reset isolation prevents some PINCNTL registers from being reset.

For details on EMAC Switch reset isolation, see the descriptions of the RESET_ISO register and the PINCNTL registers in the *Control Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

Internal pull-up/down (IPU/IPD) resistors are enabled during and immediately after reset as described in Section 3.2, *Terminal Functions* of this document.

NOTE

Upon coming out of reset, the ARM Cortex-A8 starts executing code from the internal Boot ROM. The Boot ROM code modifies the PINCNTLx registers to configure the associated pins for the chosen primary and backup Bootmodes. For more details on the Boot ROM effects on pin multiplexing, see the *ROM Code Memory and Peripheral Booting* and *Control Module* chapters of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.3.18 Reset Electrical Data/Timing

Table 7-9. Timing Requirements for Reset (see Figure 7-4 and Figure 7-5)

NO.				OPP100 MIN	OPP100 MAX	UNIT
1	$t_{w(RESET)}$	Pulse duration, $\overline{POR}$ low or $\overline{RESET}$ low		12P[1]		ns
2	$t_{su(BOOT)}$	Setup time, BTMODE[15:0] pins valid before $\overline{POR}$ high or $\overline{RESET}$ high	$\overline{POR}$	2P[2]		ns
			$\overline{RESET}$	2P[2]		ns
3	$t_{h(BOOT)}$	Hold time, BTMODE[15:0] pins valid after $\overline{POR}$ high or $\overline{RESET}$ high		0		ns

(1) The device clock source ***must*** be stable and at a valid frequency prior to meeting the $t_{w(RESET)}$ requirement.
(2) P = 1/(DEV Clock) frequency in ns.

Table 7-10. Switching Characteristics Over Recommended Operating Conditions During Reset (see Figure 7-5)

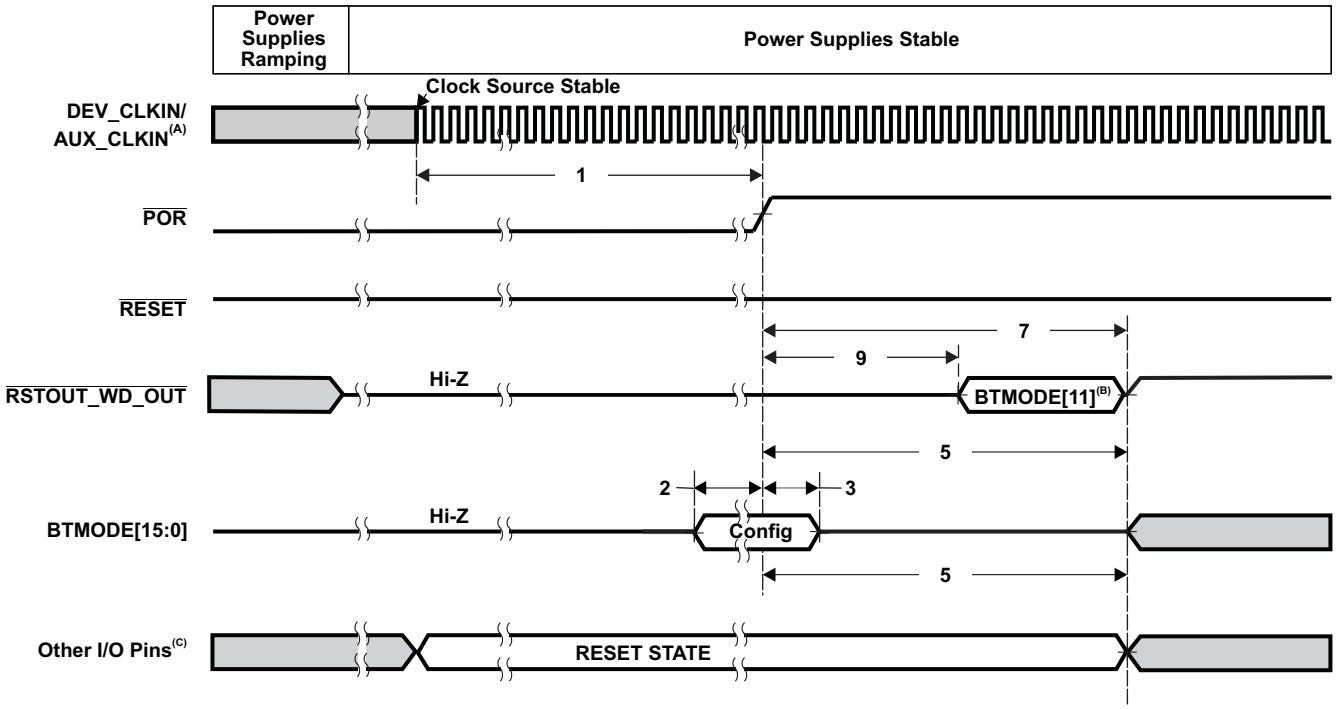
NO.	PARAMETER			OPP100 MIN	OPP100 MAX	UNIT
4	$t_{d(RSTL-IORST)}$	Delay time, $\overline{RESET}$ low or $\overline{POR}$ low to all I/Os entering their reset state			14	ns
5	$t_{d(RSTH-IOFUNC)}$	Delay time, $\overline{RESET}$ high or $\overline{POR}$ high to all I/Os exiting their reset state			14	ns
6	$t_{d(RSTH-RSTOUTH)}$	Delay time, $\overline{RESET}$ high to $\overline{RSTOUT\_WD\_OUT}$ high[1][2]	$\overline{RESET}$ assertion $t_{w(RESET)}$ ≥ 30P	0	2P	ns
			$\overline{RESET}$ assertion $t_{w(RESET)}$ < 30P	0	32P - $t_{w(RESET)}$	ns
7	$t_{d(PORH-RSTOUTH)}$	Delay time, $\overline{POR}$ high to $\overline{RSTOUT\_WD\_OUT}$ high[1][2]		0	12500P	ns
8	$t_{d(RSTL-RSTOUTZ)}$	Delay time, $\overline{RESET}$ low to $\overline{RSTOUT\_WD\_OUT}$ Hi-Z[1][2]		0	2P	ns

(1) For more detailed information on $\overline{RSTOUT\_WD\_OUT}$ pin behavior, see Section 7.3.14, *$\overline{RSTOUT\_WD\_OUT}$ Pin*.
(2) P = 1/(DEV Clock) frequency in ns.

Table 7-10. Switching Characteristics Over Recommended Operating Conditions During Reset (see Figure 7-5) (continued)

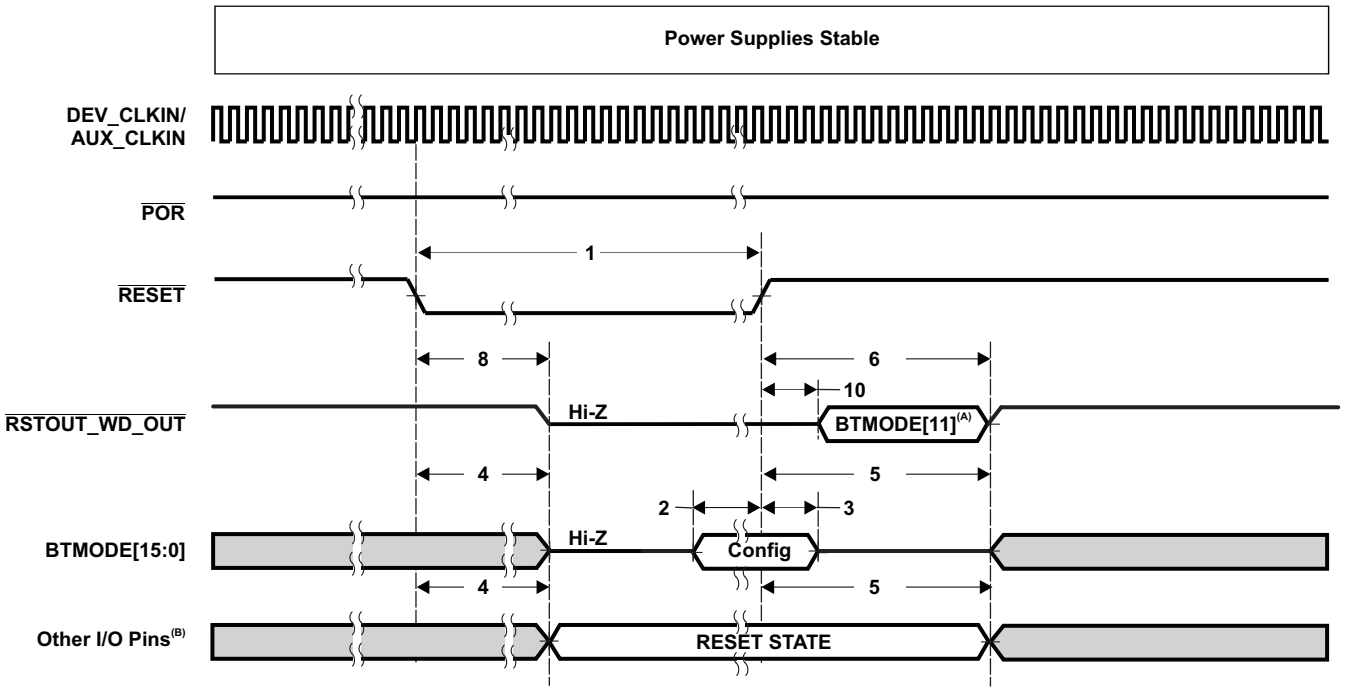
NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
9	$t_{d(PORH-RSTOUTL)}$	Delay time, $\overline{POR}$ high to $\overline{RSTOUT\_WD\_OUT}$ driven based on latched BTMODE[11] value(1)(2)	0	2P	ns
10	$t_{d(RSTH-RSTOUTD)}$	Delay time, $\overline{RESET}$ high to $\overline{RSTOUT\_WD\_OUT}$ driven based on latched BTMODE[11] value(1)(2)	0	2P	ns

Figure 7-4 shows the Power-Up Timing. Figure 7-5 shows the Warm Reset ($\overline{RESET}$) Timing. Max Reset Timing is identical to Warm Reset Timing, except the BTMODE[15:0] pins are ***not*** re-latched.



A. Power supplies and DEV_CLKIN/AUX_CLKIN must be stable before the start of $t_{w(RESET)}$.
B. $\overline{RSTOUT\_WD\_OUT}$ only asserted if BTMODE[11] was latched as a "0" when coming out of reset.
C. For more detailed information on the RESET STATE of each pin, see Section 7.3.17, *Pin Behaviors at Reset*. Also see Section 3.2, *Terminal Functions* for the IPU/IPD settings during reset.

Figure 7-4. Power-Up Timing



A. RSTOUT_WD_OUT only asserted if BTMODE[11] was latched as a "0" when coming out of reset.

B. For more detailed information on the RESET STATE of each pin, see Section 7.3.17, *Pin Behaviors at Reset*. Also see Section 3.2, *Terminal Functions* for the IPU/IPD settings during reset.

Figure 7-5. Warm Reset (RESET) Timing

7.4 Clocking

The device clocks are generated from several reference clocks that are fed to on-chip PLLs and dividers (both inside and outside of the PRCM Module). Figure 7-6 shows a high-level overview of the device system clocking structure (Note: to reduce complexity, not all clocking connections are shown). For detailed information on the device clocks, see the Clock Generation and Management section of the *Power, Reset, and Clock Management (PRCM) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

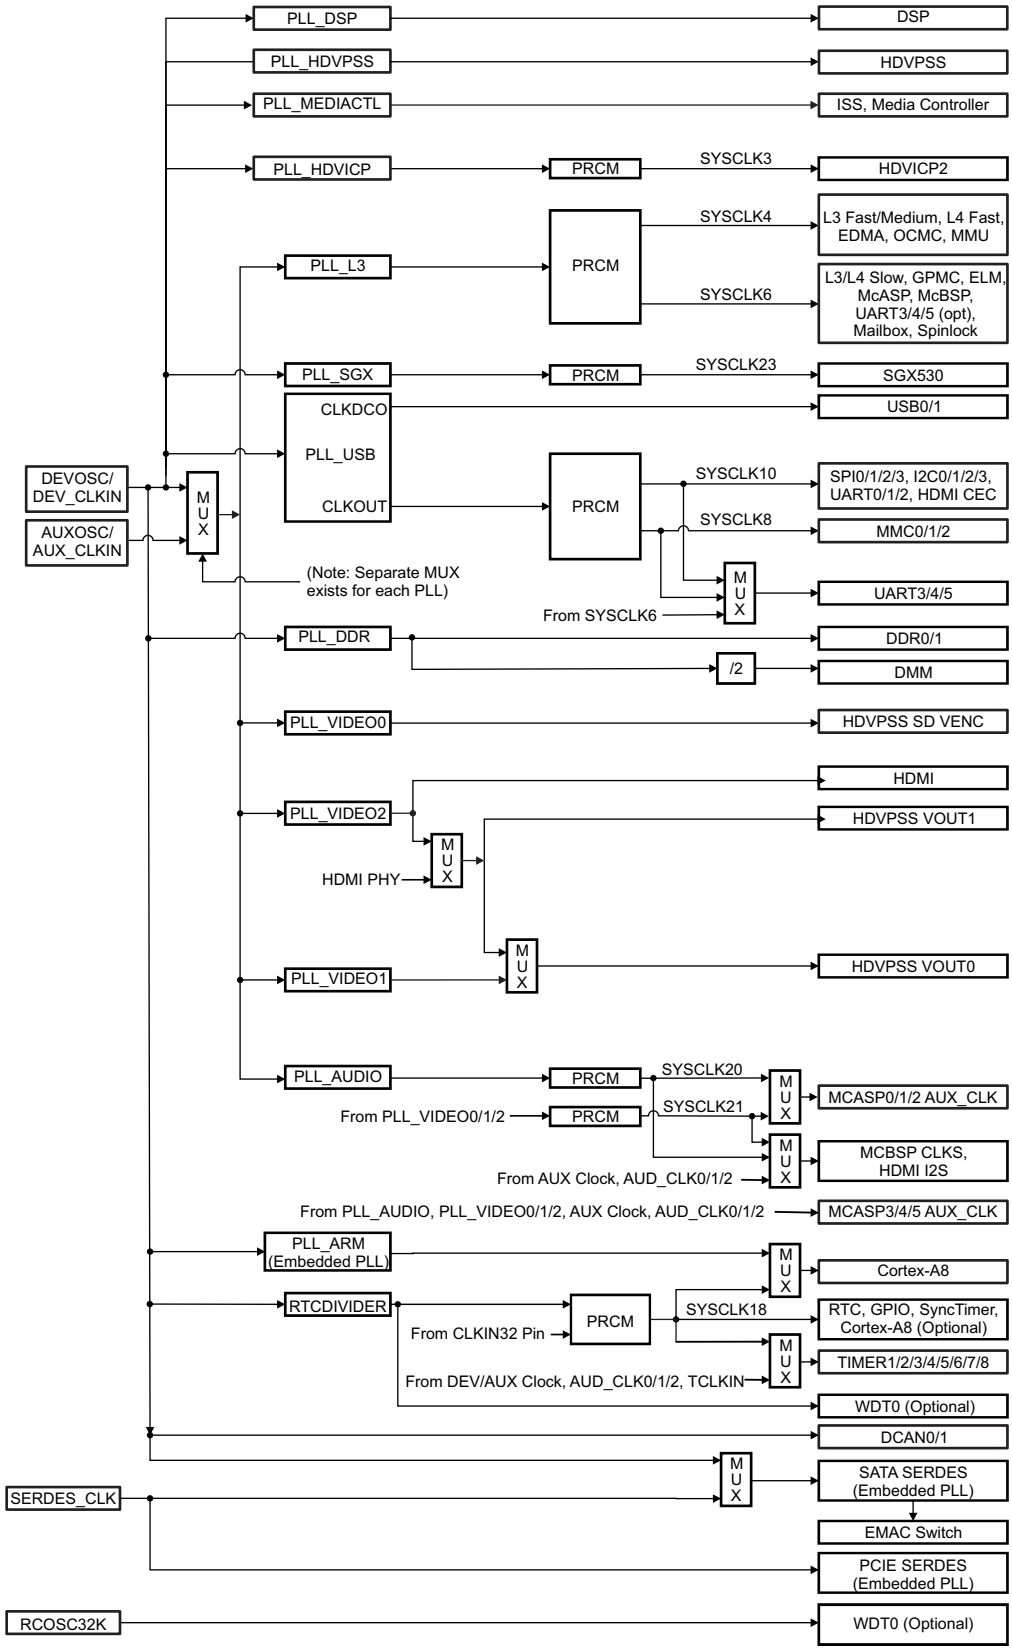


Figure 7-6. System Clocking Overview

7.4.1 Device (DEV) and Auxiliary (AUX) Clock Inputs

The device provides two clock inputs, Device (DEVOSC_MXI/DEV_CLKIN) and Auxiliary (AUXOSC_MXI/AUX_CLKIN). The Device (DEV) clock is used to generate the majority of the internal reference clocks, while the Auxiliary (AUX) clock can optionally be used as a source for the Audio and/or Video PLLs.

The DEV and AUX clocks can be sourced in two ways:

1. Using an external crystal in conjunction with the internal oscillator *or*
2. Using an external 1.8-V LVCMOS-compatible clock input

Note: The external crystals used with the internal oscillators ***must*** operate in fundamental parallel resonant mode *only*. There is no overtone support.

The DEV Clock should in most cases be 20 MHz. However, it can optionally range anywhere from 20 - 30 MHz if the following are true:

- The DEV Clock is not used to source the SATA reference clock
- A precise 32768-Hz clock is not needed for Real-Time Clock functionality
- If the boot mode is FAST XIP

The AUX Clock is optional and can range from 20-30 MHz. AUX Clock can be used to source the Audio and/or Video PLLs when a very precise audio or video frequency is required.

7.4.1.1 Using the Internal Oscillators

When the internal oscillators are used to generate the DEV and AUX clocks, external crystals are required to be connected across the DEVOSC or AUXOSC oscillator MXI and MXO pins, along with two load capacitors (see Figure 7-7 and Figure 7-8). The external crystal load capacitors should also be connected to the associated oscillator ground pin (VSSA_DEVOSC or VSSA_AUXOSC). The capacitors should ***not*** be connected to board ground (VSS).

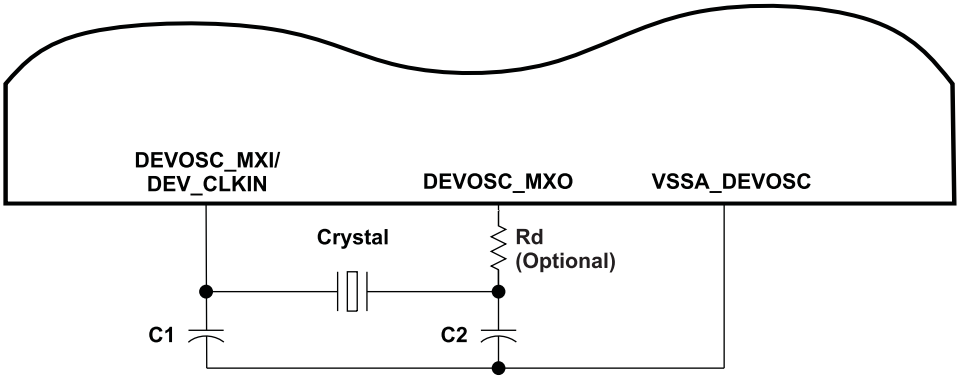

Figure 7-7. Device Oscillator

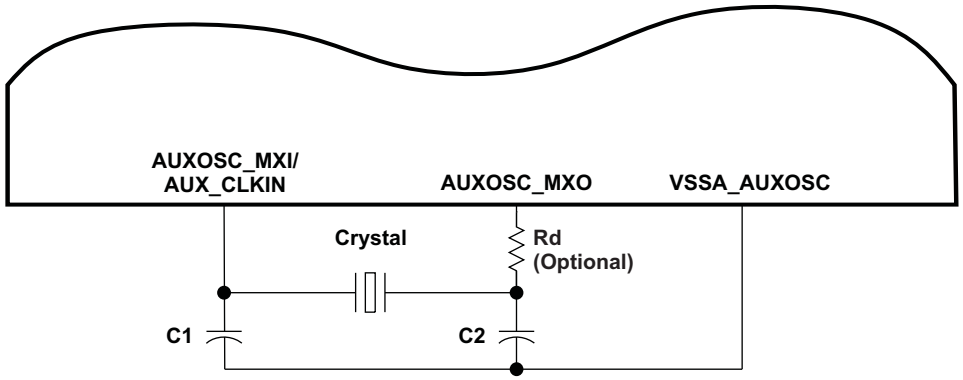

Figure 7-8. Auxiliary Oscillator

The load capacitors, C1 and C2 in the above pictures, should be chosen such that the below equation is satisfied. CL in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator MXI, MXO, and VSS pins.

$$C_L = \frac{C_1 C_2}{(C_1 + C_2)}$$

Table 7-11. Input Requirements for Crystal Circuit on the Device Oscillator (DEVOSC)

PARAMETER			MIN	TYP	MAX	UNIT
	Start-up time (from power up until oscillating at stable frequency)				4	ms
	Crystal Oscillation frequency(1)		20	20	30	MHz
	Parallel Load Capacitance (C1 and C2)		12		24	pF
	Crystal ESR				50	Ω
	Crystal Shunt Capacitance				5	pF
	Crystal Oscillation Mode			Fundamental Only		n/a
	Crystal Frequency Stability	If Ethernet not used			±200	ppm
		If MII ***is*** used and RGMII, RMII not used			±100	
		If RGMII, or RMII used			±50	

(1) 20-MHz DEV clock is required for all bootmodes other than Fast XIP. For more detailed information on boot modes, see the *ROM Code Memory and Peripheral Booting* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

Table 7-12. Input Requirements for Crystal Circuit on the Auxiliary Oscillator (AUXOSC)

PARAMETER		MIN	MAX	UNIT
	Start-up time (from power up until oscillating at stable frequency)		4	ms
	Crystal Oscillation frequency	20	30	MHz
	Parallel Load Capacitance (C1 and C2)	12	24	pF
	Crystal ESR		50	Ω
	Crystal Shunt Capacitance		5	pF
	Crystal Oscillation Mode	Fundamental Only		n/a
	Crystal Frequency stability(1)		±50	ppm

(1) Applies only when sourcing the HDMI or HDVPSS DAC clocks from the AUXOSC

7.4.1.2 Using a 1.8V LVCMOS-Compatible Clock Input

A 1.8-V LVCMOS-Compatible Clock Input can be used instead of the internal oscillators as the DEV and AUX clock inputs to the system. The external connections to support this are shown in Figure 7-9 and Figure 7-10. The DEV_CLKIN and AUX_CLKIN pins are connected to the 1.8-V LVCMOS-Compatible clock sources. The DEV_MXO and AUX_MXO pins are left unconnected. The VSSA_DEVOSC and VSSA_AUXOSC pins are connected to board ground (VSS).

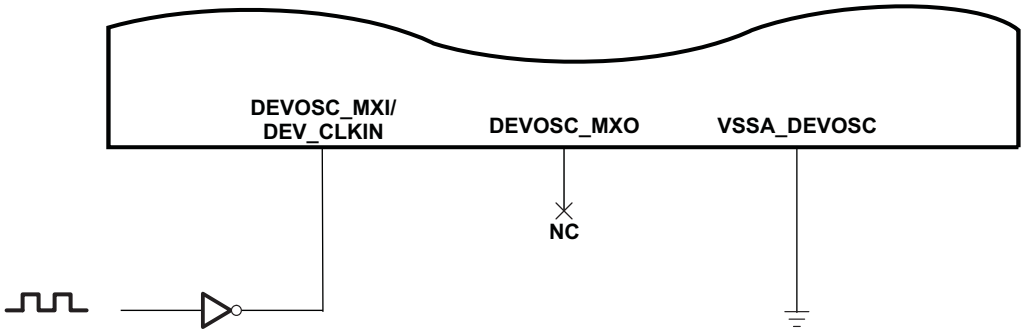

Figure 7-9. 1.8-V LVCMOS-Compatible Clock Input (DEV_OSC)

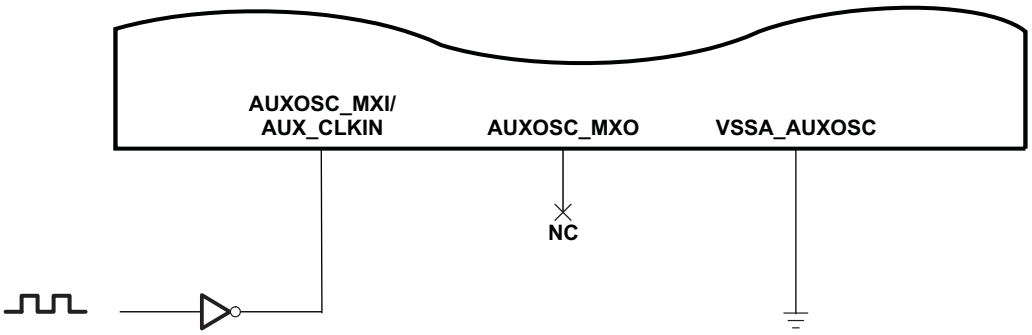

Figure 7-10. 1.8-V LVCMOS-Compatible Clock Input (AUX_OSC)

The clock source ***must*** meet the DEVOSC_MXI/DEV_CLKIN timing requirements shown in Table 7-15, *Timing Requirements for DEVOSC_MXI/DEV_CLKIN*.

The clock source must meet the AUXOSC_MXI/AUX_CLKIN timing requirements shown in Table 7-16, *Timing Requirements for AUXOSC_MXI/AUX_CLKIN*.

7.4.2 SERDES_CLKN/P Input Clock

A high-quality, low-jitter differential clock source is required for the PCIE PHY and is an optional clock source for the SATA PHY. The clock is required to be AC coupled to the SERDES_CLKP and SERDES_CLKN device pins according to the specifications in Table 7-13. Both the clock source and the coupling capacitors should be placed physically as close to the processor as possible. In addition, make sure to follow any PCB routing and termination recommendations that the clock source manufacturer recommends.

Table 7-13. SERDES_CLKN/P AC Coupling Capacitors Recommendations

PARAMETER		MIN	TYP	MAX	UNIT
	SERDES_CLKN/P AC coupling capacitor value	0.24	0.27	1.0	nF

Table 7-13. SERDES_CLKN/P AC Coupling Capacitors Recommendations (continued)

PARAMETER		MIN	TYP	MAX	UNIT
	SERDES_CLKN/P AC coupling capacitor package size(1)(2)		0402	0603	EIA

(1) L x W, 10 Mil units, that is, a 0402 is a 40 x 20 Mil surface mount capacitor.
(2) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair placed side-by-side.

The differential clock source is required to meet the REFCLK AC Specifications outlined in the *PCI EXPRESS CARD ELECTROMECHANICAL SPECIFICATION, REV. 2.0*, at the input to the AC coupling capacitors.

In addition, LVDS clock sources that are compliant to the above specification, but with the following exceptions, are also acceptable:

Table 7-14. Acceptable Exceptions to the REFCLK AC Specifications for LVDS Clock Sources

PARAMETER		MIN	MAX	UNIT
V_{IH}	Differential High-Level Input Voltage	125	1000	mV
V_{IL}	Differential Low-Level Input Voltage	-1000	-125	mV

7.4.3 AUD_CLKINx Input Clocks

External clock inputs can optionally be provided at the AUD_CLKIN0/1/2 pins to serve as a reference clocks for the following modules:

- McASP3/4/5
- McBSP
- TIMER1/2/3/4/5/6/7/8

7.4.4 CLKIN32 Input Clock

An external 32768-Hz clock input can optionally be provided at the CLKIN32 pin to serve as a reference clock in place of the RTCDIVIDER clock for the following Modules:

- RTC
- GPIO0/1/2/3
- TIMER1/2/3/4/5/6/7/8
- ARM Cortex-A8
- SYNCTIMER

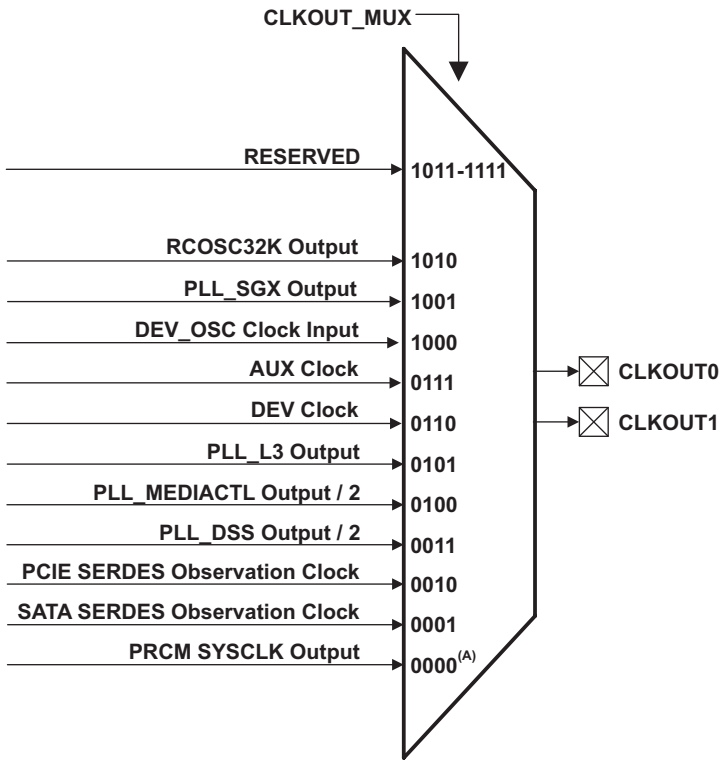
The CLKIN32 source must meet the timing requirements shown in Table 7-18.

7.4.5 External Input Clocks

There are three pins referred to as AUD_CLKIN0,1,2 which are used as optional sources for HDMI I2S, McASP, McBSP and TIMER1-8. The maximum IO pin frequency for these three input clocks is 50MHz.

7.4.6 Output Clocks Select Logic

The device includes two selectable general-purpose clock outputs (CLKOUT0 and CLKOUT1). The source for these output clocks is controlled by the CLKOUT_MUX register in the Control Module (see Figure 7-11).



A. Muxed output of DEVOSC clock, USBPLL clock output, VIDEO0 PLL Clock output, and RTC DIVIDER output.

Figure 7-11. CLKOUTx Source Selection Logic

For detailed information on the CLKOUTx switching characteristics, see Table 7-19.

7.4.7 *Input/Output Clocks Electrical Data/Timing*

Note: If an external clock oscillator is used, a single clean power supply should be used to power both the device and the external clock oscillator circuit.

Table 7-15. Timing Requirements for DEVOSC_MXI/DEV_CLKIN(1) (2) (3)(see Figure 7-12)

NO.				OPP100			UNIT
				MIN	NOM	MAX	
1	$t_{c(DMXI)}$	Cycle time, DEVOSC_MXI/DEV_CLKIN		33.$\overline{33}$	50	50	ns
2	$t_{w(DMXIH)}$	Pulse duration, DEVOSC_MXI/DEV_CLKIN high		0.45C		0.55C	ns
3	$t_{w(DMXIL)}$	Pulse duration, DEVOSC_MXI/DEV_CLKIN low		0.45C		0.55C	ns
4	$t_{t(DMXI)}$	Transition time, DEVOSC_MXI/DEV_CLKIN				7	ns
5	$t_{J(DMXI)}$	Period jitter, DEVOSC_MXI/DEV_CLKIN				0.02C	ns
		Frequency Stability	If Ethernet not used			±200	ppm
			If MII is used and RGMII, RMII not used			±100	
			If RGMII, or RMII used			±50	

(1) The DEVOSC_MXI/DEV_CLKIN frequency and PLL settings should be chosen such that the resulting SYSCLKs and Module Clocks are within the specific ranges shown in the Section 7.4.9, *SYSCLKs* and Section 7.4.10, *Module Clocks*.
(2) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
(3) C = DEV_CLKIN cycle time in ns. For example, when DEVOSC_MXI/DEV_CLKIN frequency is 20 MHz, use C = 50 ns.

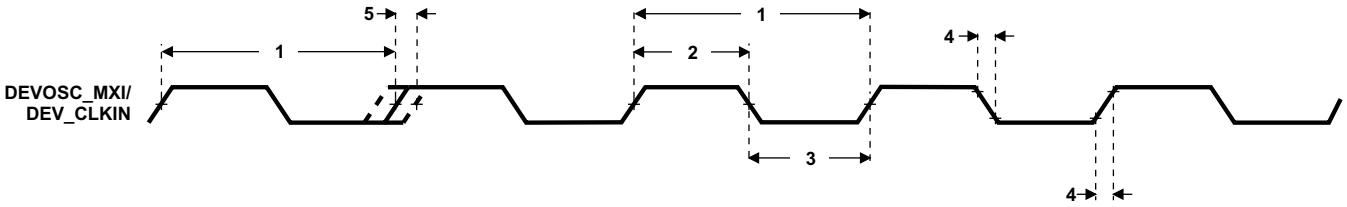


Figure 7-12. DEV_MXI/DEV_CLKIN Timing

Table 7-16. Timing Requirements for AUX_MXI/AUX_CLKIN (1) (2) (see Figure 7-13)

NO.			OPP100			UNIT
			MIN	NOM	MAX	
1	$t_{c(AMXI)}$	Cycle time, AUXOSC_MXI/AUX_CLKIN	33.$\overline{3}$	50	50	ns
2	$t_{w(AMXIH)}$	Pulse duration, AUXOSC_MXI/AUX_CLKIN high	0.45C		0.55C	ns
3	$t_{w(AMXIL)}$	Pulse duration, AUXOSC_MXI/AUX_CLKIN low	0.45C		0.55C	ns
4	$t_{t(AMXI)}$	Transition time, AUXOSC_MXI/AUX_CLKIN			7	ns
5	$t_{J(AMXI)}$	Period jitter, AUXOSC_MXI/AUX_CLKIN			0.02C	ns
6	S_f	Frequency stability, AUXOSC_MXI/AUX_CLKIN (3)			± 50	ppm

(1) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
(2) C = AUX_CLKIN cycle time in ns. For example, when AUXOSC_MXI/AUX_CLKIN frequency is 20 MHz, use C = 50 ns.
(3) Applies only when sourcing the HDMI or HDVPSS DAC clocks from the AUXOSC.

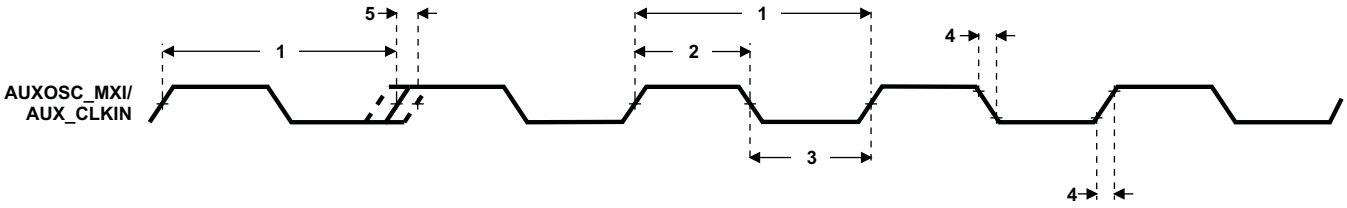

Figure 7-13. AUX_MXI/AUX_CLKIN Timing

Table 7-17. Timing Requirements for AUD_CLKINx (1) (see Figure 7-14)

NO.			OPP100/120/166			UNIT
			MIN	NOM	MAX	
1	$t_{c(AUD\_CLKINx)}$	Cycle time, AUD_CLKINx	20			ns
2	$t_{w(AUD\_CLKINxH)}$	Cycle time, AUD_CLKINx	0.45A		0.55 A	ns
3	$t_{w(AUD\_CLKINxL)}$	Cycle time, AUD_CLKINx	0.45A		0.55 A	ns

(1) A = AUD_CLKINx cycle time in ns.

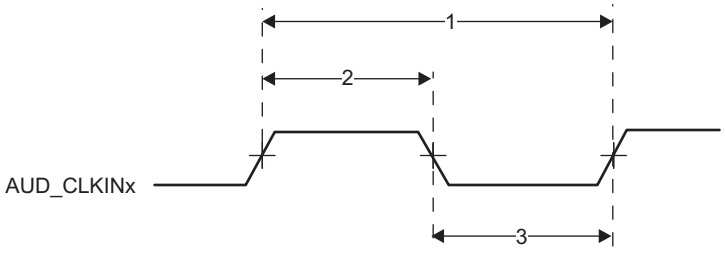

Figure 7-14. AUD_CLKINx Timing

Table 7-18. Timing Requirements for CLKIN32 (1)(2) (see Figure 7-15)

NO.			OPP100			UNIT
			MIN	NOM	MAX	
1	$t_{c(CLKIN32)}$	Cycle time, CLKIN32	1/32768			s
2	$t_{w(CLKIN32H)}$	Pulse duration, CLKIN32 high	0.45C		0.55C	ns
3	$t_{w(CKIN32L)}$	Pulse duration, CLKIN32 low	0.45C		0.55C	ns
4	$t_{t(CLKIN32)}$	Transition time, CLKIN32			7	ns
5	$t_{J(CLKIN32)}$	Period jitter, CLKIN32			0.02C	ns

(1) The reference points for the rise and fall transitions are measured at V_{IL} MAX and V_{IH} MIN.
(2) C = CLKIN32 cycle time in ns. For example, when CLKIN32 frequency is 32768 Hz, use C = 1/32768 s.

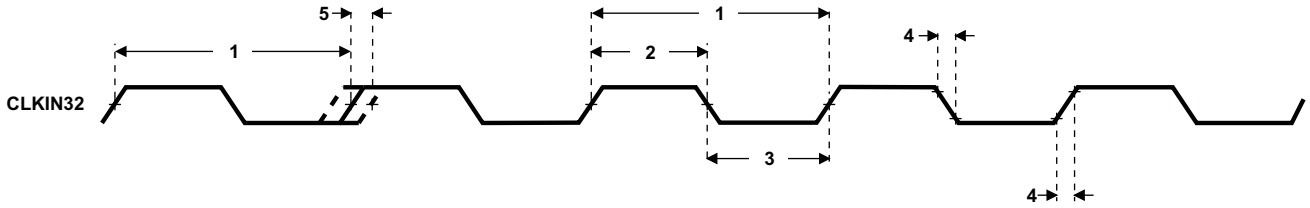

Figure 7-15. CLKIN32 Timing

Table 7-19. Switching Characteristics Over Recommended Operating Conditions for CLKOUTx (CLKOUT0 and CLKOUT1)(1) (2) (see Figure 7-16)

NO.	PARAMETER		OPP100		UNIT
			MIN	MAX	
1	$t_{c(CLKOUTx)}$	Cycle time, CLKOUTx	5		ns
2	$t_{w(CLKOUTxH)}$	Pulse duration, CLKOUTx high	0.45P	0.55P	ns
3	$t_{w(CLKOUTxL)}$	Pulse duration, CLKOUTx low	0.45P	0.55P	ns
4	$t_{t(CLKOUTx)}$	Transition time, CLKOUTx		0.05P	ns

(1) The reference points for the rise and fall transitions are measured at V_{OL} MAX and V_{OH} MIN.
(2) P = 1/CLKOUTx clock frequency in nanoseconds (ns). For example, when CLKOUTx frequency is 200 MHz, use P = 5 ns.

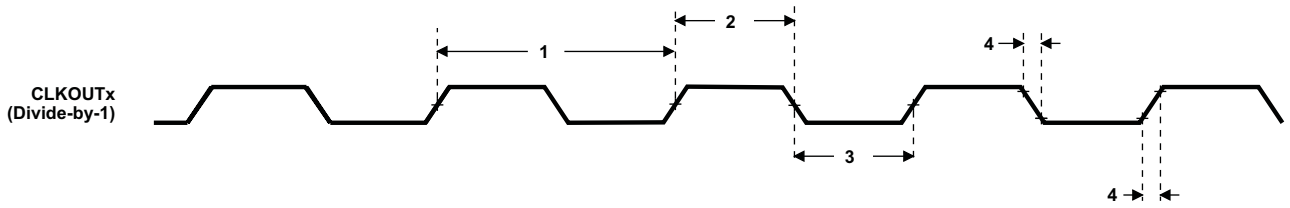

Figure 7-16. CLKOUTx Timing

7.4.8 PLLs

The device contains 12 top-level PLLs, and 4 embedded PLLs (within the ARM Cortex-A8, PCIE, SATA, and CSI) that provide clocks to different parts of the system. Figure 7-17 and Figure 7-18 show simplified block diagrams of the Top-Level PLL and PLL_ARM. In addition, see the System Clocking Overview (Figure 7-6) for a high-level view of the device clock architecture including the PLL reference clock sources and connections.

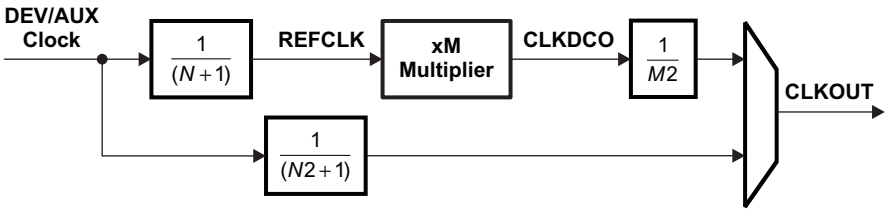

Figure 7-17. Top-Level PLL Simplified Block Diagram

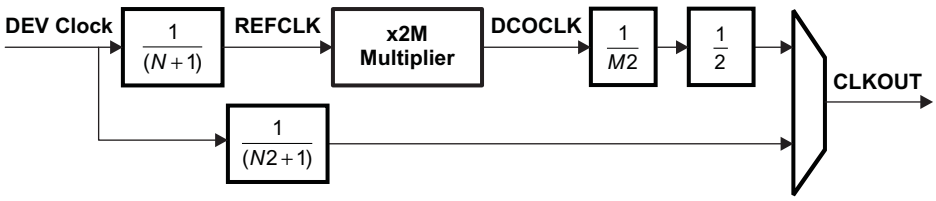

Figure 7-18. PLL_ARM Simplified Block Diagram

The reference clock for most of the PLLs comes from the DEV input clock, with select PLLs also having the option to use the AUX input clock as a reference. Also, each PLL supports a Bypass mode in which the reference clock can be directly passed to the PLL CLKOUT through a divider. All device PLL's will come-up in Bypass mode after reset.

For details on programming the device PLLs, see the *Control Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.4.8.1 PLL Power Supply Filtering

The device PLLs are supplied externally via the VDDA_**x**PLL_1P8 power-supply pins (where "**x**" represents ARM, DSP, VID0, VID1, AUDIO, DDR, and/or L3). External filtering must be added on the PLL supply pins to ensure that the requirements in Table 7-20 are met.

Table 7-20. PLL Power Supply Requirements

PARAMETER	MIN	MAX	UNIT
Dynamic noise at VDDA_**x**PLL_1P8 pins		50	mV p-p

7.4.8.2 PLL Multipliers and Dividers

The Top-Level and PLL_ARM PLLs support the internal multiplier and divider values shown in Table 7-21, *Top-Level PLL Multiplier and Divider Limits* and Table 7-22, *PLL_ARM Multiplier and Divider Limits*. The PLLs must be programmed to conform to the various REFCLK, CLKDCO, DCOCLK, and CLKOUT limits described in Section 7.4.8.3, *PLL Frequency Limits*.

Table 7-21. Top-Level PLL Multiplier and Divider Limits

PARAMETER	MIN	MAX
N Pre-Divider	0	255
PLL Multiplier (M)	2	4095(1)
M2 Post Divider	1	127
N2 Bypass Divider	0	15

(1) The PLL Multiplier supports fractional values (up to 18-bits of fraction) except when the PLL Multiplier is > 4093.

Table 7-22. PLL_ARM Multiplier and Divider Limits

PARAMETER	MIN	MAX
N Pre-Divider	0	127
PLL Multiplier (M)(1)	2	2047(2)
M2 Post Divider	1	31
N2 Bypass Divider	0	15

(1) This parameter describes the limits on the programmable multiplier value M. The multiplication factor for the PLL_ARM is equal to 2 * M (also see Figure 7-18).
(2) The PLL Multiplier supports fractional values (up to 18-bits of fraction) except when the PLL Multiplier is < 20 OR > 2045.

7.4.8.3 PLL Frequency Limits

Each PLL supports a minimum and maximum operating frequency for its REFCLK, CKLDCO, and CLKOUT values. The PLLs must be configured not to exceed any of the constraints placed on these values shown in Table 7-23 through Table 7-25. Care must be taken to stay within these limits when selecting external clock input frequencies, internal divider values, and PLL multiply ratios. In addition, limits shown in these tables may be further restricted by the clock frequency limitations of the device modules using these clocks. For more detailed information on the SYSCLK and Module Clock frequency limits, see Section 7.4.9, *SYSCLKs* and Section 7.4.10, *Module Clocks*.

Table 7-23. Top-Level PLL Frequency Ranges (ALL OPPs)

CLOCK	MIN	MAX	UNIT
REFCLK	0.5	2.5	MHz
CLKDCO (HS1)(1)	1000	2000	MHz
CLKDCO (HS2)(2)	500	1000	MHz

(1) The PLL has two modes of operation: HS1 and HS2. The mode of operation should be set, according to the desired CLKDCO frequency, by programming the SELFREQDCO field of the ADPLLLJx_CLKCTRL registers in the Control Module.
(2) CLKDCO of the PLL_USB is used undivided by the USB modules; therefore, CLKDCO for the PLL_USB PLL must be programmed to 960 MHz for proper operation.

Table 7-23. Top-Level PLL Frequency Ranges (ALL OPPs) (continued)

CLOCK	MIN	MAX	UNIT
CLKOUT	see Table 7-25	see Table 7-25	MHz

Table 7-24. ARM Cortex-A8 Embedded PLL (PLL_ARM) Frequency Ranges (ALL OPPs)

CLOCK	MIN	MAX	UNIT
REFCLK	0.032	52	MHz
DCOCLK	20	2000	MHz
CLKOUT	see Table 7-25	see Table 7-25	MHz

Table 7-25. PLL CLKOUT Frequency Ranges

PLL	OPP100		UNIT
	MIN	MAX	
PLL_ARM	10	600	MHz
PLL_DSP	10	500	MHz
PLL_SGX	10	200	MHz
PLL_HDVICP	10	266	MHz
PLL_L3	10	200	MHz
PLL_DDR	10	400	MHz
PLL_HDVPSS	10	200	MHz
PLL_AUDIO	10	200	MHz
PLL_MEDIACTL	10	400	MHz
PLL_USB	10(1)	960	MHz
PLL_VIDEO0	10	200	MHz
PLL_VIDEO1	10	200	MHz
PLL_VIDEO2	10	200	MHz

(1) When the USB is used, PLL_USB **must** be fixed at 960 MHz.

7.4.8.4 PLL Register Descriptions

The PLL Control Registers reside in the Control Module and are listed in Section 4.1, *Control Module* of this datasheet.

7.4.9 SYSCLKs

In some cases, the system clock inputs and PLL outputs are sent to the PRCM Module for division and multiplexing before being routed to the various device Modules. These clock outputs from the PRCM Module are called SYSCLKs. Table Table 7-26 lists the device SYSCLKs along with their maximum supported clock frequencies. In addition, limits shown in these tables may be further restricted by the clock frequency limitations of the device modules using these clocks. For more details on Module Clock frequency limits, see Section 7.4.10 *Module Clocks*.

Table 7-26. Maximum SYSCLK Clock Frequencies(1)

SYSCLK	MAX CLOCK FREQUENCY OPP100 (MHz)
SYSCLK1	RSV
SYSCLK2	RSV
SYSCLK3	266
SYSCLK4	200
SYSCLK5	RSV
SYSCLK6	100
SYSCLK7	RSV
SYSCLK8	192
SYSCLK9	RSV
SYSCLK10	48
SYSCLK11	RSV

SYSCLK13	RSV
SYSCLK14	27
SYSCLK15	RSV
SYSCLK16	27
SYSCLK17	RSV
SYSCLK18	0.032768
SYSCLK19	192
SYSCLK20	192
SYSCLK21	192
SYSCLK22	RSV
SYSCLK23	200

(1) The maximum frequencies listed in this table are valid for OPP100. Some of these frequencies have higher maximum values when OPP120 or OPP166 is used, see Table 7-4

7.4.10 Module Clocks

Device Modules either receive their clock directly from an external clock input, directly from a PLL, or from a PRCM SYSCLK output. Table 7-27 lists the clock source options for each Module on this device, along with the maximum frequency that Module can accept. To ensure proper Module functionality, the device PLLs and dividers **must** be programmed not to exceed the maximum frequencies listed in this table.

Table 7-27. Maximum Module Clock Frequencies(1)

MODULE	CLOCK SOURCES	MAX FREQUENCY OPP100 (MHz)

7.5 Interrupts

The device has a large number of interrupts to service the needs of its many peripherals and subsystems. The ARM Cortex-A8, C674x DSP, and Media Controller are capable of servicing these interrupts. However, the C674x DSP require additional system-level interrupt multiplexors to receive their interrupts. The following sections list the device interrupt mapping and multiplexing schemes.

7.5.1 ARM Cortex-A8 Interrupts

The ARM Cortex-A8 Interrupt Controller (AINTC) is responsible for prioritizing all service requests from the System peripherals and generating either IRQs or FIQs to the Cortex-A8. The AINTC has the capability to handle up to 128 requests, and the priority of the interrupt inputs are programmable. Table 7-28 lists the interrupt sources for the AINTC.

Note: For General-Purpose devices, the AINTC does not support the generation of FIQs to the ARM processor.

For more details on ARM Cortex-A8 interrupt control, see the ARM Interrupt Controller (AINTC) chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

7.5.2 C674x DSP Interrupts

The C674x DSP interrupt controller combines up to 128 device events into 12 prioritized interrupts presented to the CPU. The default sources of the 128 device events are shown in Table 7-29. In addition, device events 15 through 95 can alternatively be sourced from one of the 24 Multiplexed device events shown in Table 7-30. The DSP_INTMUX_x registers in the Control Module are used to select between the default event and the multiplexed event. The interrupt controller also controls the generation of the CPU exceptions, NMI, and emulation interrupts.

Table 7-29. Default C674x Event Sources

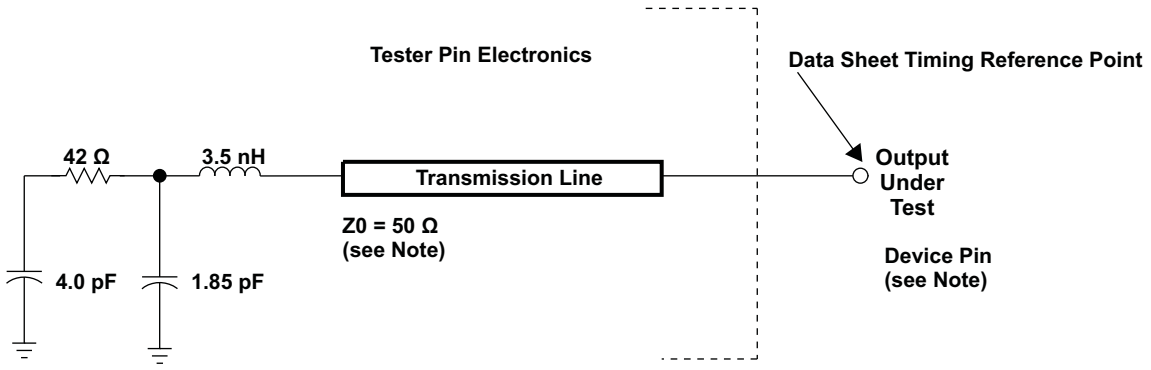
8 Peripheral Information and Timings

8.1 Parameter Information



NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

Figure 8-1. Test Load Circuit for AC Timing Measurements

The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

8.1.1 1.8-V and 3.3-V Signal Transition Levels

All input and output timing parameters are referenced to V_{ref} for both "0" and "1" logic levels. For 3.3-V I/O, V_{ref} = 1.5 V. For 1.8-V I/O, V_{ref} = 0.9 V.

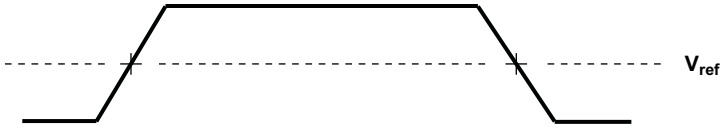


Figure 8-2. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to V_{IL} MAX and V_{IH} MIN for input clocks, V_{OL} MAX and V_{OH} MIN for output clocks.

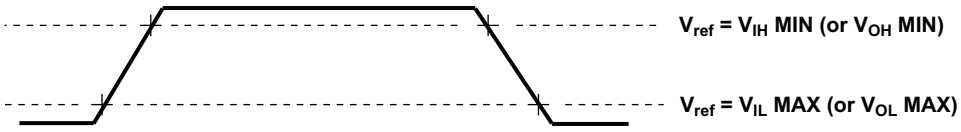

Figure 8-3. Rise and Fall Transition Time Voltage Reference Levels

8.1.2 3.3-V Signal Transition Rates

All timings are tested with an input edge rate of 4 volts per nanosecond (4 V/ns).

8.1.3 Timing Parameters and Board Routing Analysis

The timing parameter values specified in this data manual do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (Literature Number: SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

8.2 Recommended Clock and Control Signal Transition Behavior

All clocks and control signals ***must*** transition between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.

8.3 Controller Area Network Interface (DCAN)

The device provides two DCAN interfaces for supporting distributed realtime control with a high level of security. The DCAN interfaces implement the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 MBit/s
- 64 message objects
- Individual identifier mask for each message object
- Programmable FIFO mode for message objects
- Programmable loop-back modes for self-test operation
- Suspend mode for debug support
- Software module reset
- Automatic bus on after Bus-Off state by a programmable 32-bit timer
- Message RAM parity check mechanism
- Direct access to Message RAM during test mode
- CAN Rx/Tx pins are configurable as general-purpose IO pins
- Two interrupt lines (plus additional parity-error interrupts line)
- RAM initialization
- DMA support

For more detailed information on the DCAN peripheral, see the *DCAN Controller Area Network* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.3.1 DCAN Peripheral Register Descriptions

8.3.2 DCAN Electrical Data/Timing

Table 8-1. Timing Requirements for DCANx Receive(1) (see Figure 8-4)

NO.			OPP100/120/166			UNIT
			MIN	NOM	MAX	
	f(baud)	Maximum programmable baud rate			1	Mbps
1	$t_{w(DCANRX)}$	Pulse duration, receive data bit (DCANx_RX)	H - 2		H + 2	ns

(1) H = period of baud rate, 1/programmed baud rate.

Table 8-2. Switching Characteristics Over Recommended Operating Conditions for DCANx Transmit (1)(see Figure 8-4)

NO.	PARAMETER		OPP100/120/166		UNIT
			MIN	MAX	
	f(baud)	Maximum programmable baud rate		1	Mbps
2	$t_{w(DCANTX)}$	Pulse duration, transmit data bit (DCANx_TX)	H - 2	H + 2	ns

(1) H = period of baud rate, 1/programmed baud rate.

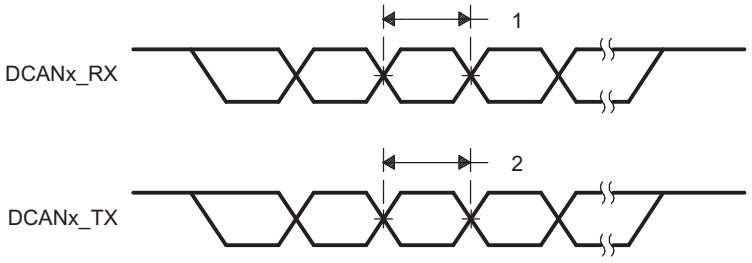

Figure 8-4. DCANx Timings

8.4 EDMA

The EDMA controller handles all data transfers between memories and the device slave peripherals on the device. These data transfers include cache servicing, non-cacheable memory accesses, user-programmed data transfers, and host accesses.

8.4.1 EDMA Channel Synchronization Events

The EDMA Channel controller supports up to 64 channels that service peripherals and memory. Each EDMA channel is mapped to a defaul EDMA synchronization event as shown in Table 8-3. By default, each event uses the parameter entry that matches its event number. However, because the device includes a channel mapping feature, each event may be mapped to any of 512 parameter table entries. For more detailed information, see the *Enhanced Direct Memory Access Controller* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.5 Emulation Features and Capability

8.5.1 Advanced Event Triggering (AET)

The device supports Advanced Event Triggering (AET). This capability can be used to debug complex problems as well as understand performance characteristics of user applications. AET provides the following capabilities:

- **Hardware Program Breakpoints:** specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- **Data Watchpoints:** specify data variable addresses, address ranges, or data values that can generate events such as halting the processor or triggering the trace capture.
- **Counters:** count the occurrence of an event or cycles for performance monitoring.
- **State Sequencing:** allows combinations of hardware program breakpoints and data watchpoints to precisely generate events for complex sequences.

For more information on AET, see the following documents:

- *Using Advanced Event Triggering to Find and Fix Intermittent Real-Time Bugs* application report (Literature Number: SPRA753)
- *Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor Systems* application report (Literature Number: SPRA387)

8.5.2 Trace

The device supports Trace at the Cortex™-A8, C674x, and System levels. Trace is a debug technology that provides a detailed, historical account of application code execution, timing, and data accesses. Trace collects, compresses, and exports debug information for analysis. The debug information can be exported to the Embedded Trace Buffer (ETB), or to the 5-pin Trace Interface (system trace only). Trace works in real-time and does not impact the execution of the system.

For more information on board design guidelines for Trace Advanced Emulation, see the *Emulation and Trace Headers Technical Reference Manual* (Literature Number: SPRU655).

8.5.3 IEEE 1149.1 JTAG

The JTAG (IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture) interface is used for BSDL testing and emulation of the device. The TRST pin only needs to be released when it is necessary to use a JTAG controller to debug the device or exercise the boundary scan functionality of the device. For maximum reliability, the device includes an internal pulldown (IPD) on the TRST pin to ensure that TRST is always asserted upon power up and the internal emulation logic of the device is always properly initialized. JTAG controllers from Texas Instruments actively drive TRST high. However, some third-party JTAG controllers may not drive TRST high but expect the use of a pullup resistor on TRST. When using this type of JTAG controller, assert TRST to initialize the device after powerup and externally drive TRST high before attempting any emulation or boundary-scan operations.

The main JTAG features include:

- 32KB embedded trace buffer (ETB)
- 5-pin system trace interface for debug
- Supports Advanced Event Triggering (AET)
- All processors can be emulated via JTAG ports
- All functions on EMU pins of the device:
  - EMU[1:0] - cross-triggering, boot mode (WIR), STM trace
  - EMU[4:2] - STM trace only (single direction)

8.5.3.1 JTAG ID (JTAGID) Register Description

Table 8-7. JTAG ID Register(1)

HEX ADDRESS	ACRONYM	REGISTER NAME
0x4814 0600	JTAGID	JTAG Identification Register(2)

(1) IEEE Standard 1149.1-1990 Standard-Test-Access Port and Boundary Scan Architecture.
(2) Read-only. Provides the device 32-bit JTAG ID.

The JTAG ID register is a read-only register that identifies to the customer the JTAG/device ID. For this device, the JTAG ID register resides at address location 0x4814 0600. The register hex value for the device is: 0x0B8F 202F. For the actual register bit names and their associated bit field descriptions, see Figure 8-5 and Table 8-8.

31 28	27 12	11 1	0
VARIANT (4-bit)	PART NUMBER (16-bit)	MANUFACTURER (11-bit)	LSB
R-xxxx	R-1011 1000 1111 0010	R-0000 0010 111	R-1

LEGEND: R/W = Read/Write; R = Read only; -*n* = value after reset

Figure 8-5. JTAG ID Register Description - Device Register Value: 0x0B8F 202F

Table 8-8. JTAG ID Register Selection Bit Descriptions

Bit	Field	Description
31:28	VARIANT	Variant (4-bit) value. Device value: xxxx. This value reflects the device silicon revision [For example, 0x0 (0000) for initial silicon revision (SR) 1.0]. • SR2.1, 0011, register value: 0x3B8F 202F • SR3.0, 0100, register value: 0x4B8F 202F For more detailed information on the current device silicon revision, see the *TMS320DM814x DaVinci™ Digital Media Processors Silicon Errata (Silicon Revisions 3.0, 2.1)* (Literature Number: SPRZ343).
27:12	PART NUMBER	Part Number (16-bit) value. Device value: 0xB8F2 (1011 1000 1111 0010)
11:1	MANUFACTURER	Manufacturer (11-bit) value. Device value: 0x017 (0000 0010 111)
0	LSB	LSB. This bit is read as a ""1 for this device.

8.5.3.2 JTAG Electrical Data/Timing

(see Figure 8-7)

NO.	PARAMETER		OPP100/120/166		UNIT
			MIN	MAX	
5	$t_{d(TCK-RTCK)}$	Delay time, TCK to RTCK with no selected subpaths (that is, ICEPick is the only tap selected - when the ARM is in the scan chain, the delay time is a function of the ARM functional clock.)	0	21	ns
6	$t_{c(RTCK)}$	Cycle time, RTCK	51.15		ns
7	$t_{w(RTCKH)}$	Pulse duration, RTCK high (40% of t_c)	20.46		ns
8	$t_{w(RTCKL)}$	Pulse duration, RTCK low (40% of t_c)	20.46		ns

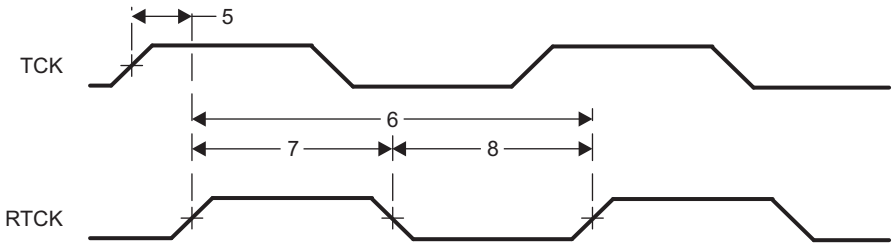

Figure 8-7. JTAG With RTCK Timing

Table 8-13. Switching Characteristics Over Recommended Operating Conditions for STM Trace

(see Figure 8-8)

NO.	PARAMETER		OPP100/120/166		UNIT
			MIN	MAX	
1	$t_{w(EMUH50)}$	Pulse duration, EMUx high detected at 50% V_{OH} with 60/40 duty cycle	4 (1)		ns
	$t_{w(EMUH90)}$	Pulse duration, EMUx high detected at 90% V_{OH}	3.5		ns
2	$t_{w(EMUL50)}$	Pulse duration, EMUx low detected at 50% V_{OH} with 60/40 duty cycle	4 (1)		ns
	$t_{w(EMUL10)}$	Pulse duration, EMUx low detected at 10% V_{OH}	3.5		ns
3	$t_{sko(EMU)}$	Output skew time, time delay difference between EMUx pins configured as trace.	-2	0.5	ns
	$t_{skp(EMU)}$	Pulse skew, magnitude of difference between high-to-low (t_{PHL}) and low-to-high (t_{PLH}) propagation delays		1 (1)	ns
	$t_{sldp\_o(EMU)}$	Output slew rate EMUx	3.3		V/ns

(1) This parameter applies to the maximum trace export frequency operating in a 40/60 duty cycle.

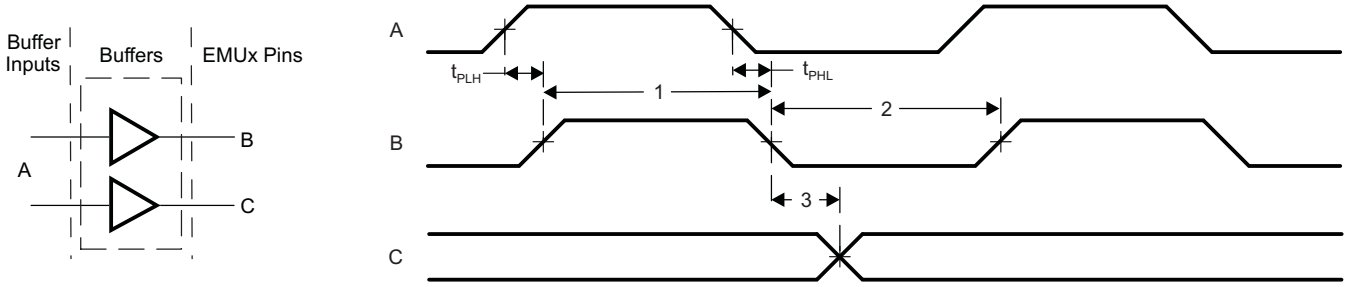

Figure 8-8. STM Trace Timing

8.6 Ethernet MAC Switch (EMAC SW)

The EMAC SW controls the flow of packet data between the device and two external Ethernet PHYs, with hardware flow control and quality-of-service (QOS) support. The EMAC SW contains a 3-port gigabit switch, where one port is internally connected and the other two ports are brought out externally. Each of the external EMAC ports supports 10Base-T (10 Mbits/second [Mbps]), and 100BaseTX (100 Mbps), in either half- or full-duplex mode, and 1000BaseT (1000 Mbps) in full-duplex mode.

The EMAC SW controls the flow of packet data from the device to the external PHYs. The EMAC0/1 ports on the device support four interface modes: Media Independent Interface (MII), Gigabit Media Independent Interface (GMII), Reduced Media Independent Interface (RMII) and Reduced Gigabit Media Independent Interface (RGMII). In addition, a single MDIO interface is pinned out to control the PHY configuration and status monitoring. Multiple external PHYs can be controlled by the MDIO interface.

The EMAC SW module conforms to the IEEE 802.3-2002 standard, describing the “Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer” specifications. The IEEE 802.3 standard has also been adopted by ISO/IEC and re-designated as ISO/IEC 8802-3:2000(E). Deviating from this standard, the EMAC SW module does not use the Transmit Coding Error signal MTXER. Instead of driving the error pin when an underflow condition occurs on a transmitted frame, the EMAC SW will intentionally generate an incorrect checksum by inverting the frame CRC, so that the transmitted frame will be detected as an error by the network. In addition, the EMAC SW I/Os operate at 3.3 V and are not compatible with 2.5-V I/O signaling. Therefore, only Ethernet PHYs with 3.3-V I/O interface should be used.

In networking systems, packet transmission and reception are critical tasks. The communications port programming interface (CPPI) protocol maximizes the efficiency of interaction between the host software and communications modules. The CPPI block contains 2048 words of 32-bit buffer descriptor memory that holds up to 512 buffer descriptors.

For more detailed information on the EMAC SW module, see the *3PSW Ethernet Subsystem* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

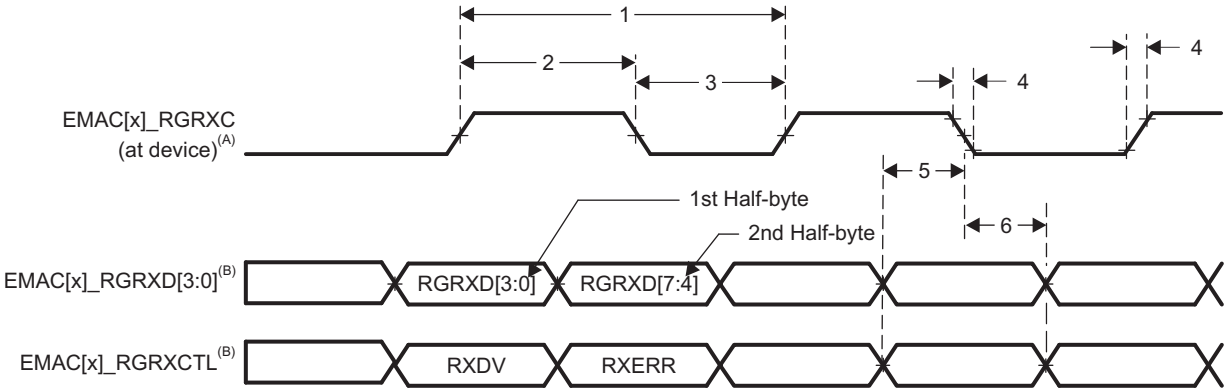
Table 8-24. Timing Requirements for EMAC RGMII Input Receive for 10/100/1000 Mbps(1)

(see Figure 8-16)

NO.			OPP100/120/166		UNIT
			MIN	MAX	
5	$t_{su(RGRXD-RGRXCH)}$	Setup time, receive selected signals valid before EMAC[x]_RGRXC (at device) high/low	1.0		ns
6	$t_{h(RGRXCH-RGRXD)}$	Hold time, receive selected signals valid after EMAC[x]_RGRXC (at device) high/low	1.0		ns

(1) For RGMII, receive selected signals include: EMAC[x]_RGRXD[3:0] and EMAC[x]_RGRXCTL.



A. EMAC[x]_RGRXC must be externally delayed relative to the data and control pins. The internal delay can be enabled or disabled via the EMAC RGMIIx_ID_MODE register.

B. Data and control information is received using both edges of the clocks. EMAC[x]_RGRXD[3:0] carries data bits 3-0 on the rising edge of EMAC[x]_RGRXC and data bits 7-4 on the falling edge of EMAC[x]_RGRXC. Similarly, EMAC[x]_RGRXCTL carries RXDV on rising edge of EMAC[x]_RGRXC and RXERR on falling edge of EMAC[x]_RGRXC.

8.6.3 Management Data Input/Output (MDIO)

The Management Data Input/Output (MDIO) module continuously polls all 32 MDIO addresses in order to enumerate all PHY devices in the system.

The MDIO module implements the 802.3 serial management interface to interrogate and control Ethernet PHYs using a shared two-wire bus. Host software uses the MDIO module to configure the auto-negotiation parameters of each PHY attached to the EMAC SW, retrieve the negotiation results, and configure required parameters in the EMAC SW module for correct operation. The module is designed to allow almost transparent operation of the MDIO interface, with very little maintenance from the core processor. A single MDIO interface is pinned out to control the PHY configuration and status monitoring. Multiple external PHYs can be controlled by the MDIO interface.

For more detailed information on the MDIO peripheral, see the *3PSW Ethernet Subsystem* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.7 General-Purpose Input/Output (GPIO)

The GPIO peripheral provides general-purpose pins that can be configured as either inputs or outputs. When configured as an output, a write to an internal register controls the state driven on the output pin. When configured as an input, the state of the input is detectable by reading the state of an internal register. In addition, the GPIO peripheral can produce CPU interrupts in different interrupt generation modes. The GPIO peripheral provides generic connections to external devices.

The device contains four GPIO modules and each GPIO module is made up of 32 identical channels.

The device GPIO peripheral supports the following:

- Up to 128 1.8-V/3.3-V GPIO pins, GP0[0:31], GP1[0:31], GP2[0:31], and GP3[0:31] (the exact number available varies as a function of the device configuration). Each channel can be configured to be used in the following applications:
  - Data input/output
  - Keyboard interface with a de-bouncing cell
  - Synchronous interrupt generation (in active mode) upon the detection of external events (signal transitions and/or signal levels).
- Synchronous interrupt requests from each channel are processed by four identical interrupt generation sub-modules to be used independently by the ARM, DSP, or Media Controller. Interrupts can be triggered by rising and/or falling edge, specified for each interrupt-capable GPIO signal.
- Shared registers can be accessed through "Set and Clear" protocol. Software writes 1 to corresponding bit position or positions to set or to clear the GPIO signal. This allows multiple software processes to toggle GPIO output signals without critical section protection (disable interrupts, program GPIO, re-enable interrupts, to prevent context switching to another process during GPIO programming).
- Separate input/output registers.
- Output register in addition to set/clear so that, if preferred by software, some GPIO output signals can be toggled by direct write to the output register.
- Output register, when read, reflects output drive status. This, in addition to the input register reflecting pin status and open-drain I/O cell, allows wired logic to be implemented.

For more detailed information on GPIOs, see the *General-Purpose I/O (GPIO) Interface* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.8 General-Purpose Memory Controller (GPMC) and Error Location Module (ELM)

The GPMC is a device memory controller used to provide a glueless interface to external memory devices such as NOR Flash, NAND Flash (with BCH and Hamming Error Code Detection for 8-bit or 16-bit NAND Flash), SRAM, and Pseudo-SRAM. The GPMC includes flexible asynchronous protocol control for interface to SRAM-like memories and custom logic (FPGA, CPLD, ASICs, etc.).

Other supported features include:

- 8-/16-bit wide multiplexed address/data bus
- 512 MBytes maximum addressing capability divided among up to eight chip selects
- Non-multiplexed address/data mode
- Pre-fetch and write posting engine associated with system DMA to get full performance from NAND device with minimum impact on NOR/SRAM concurrent access.

The device also contains an Error Locator Module (ELM) which is used to extract error addresses from syndrome polynomials generated using a BCH algorithm. Each of these polynomials gives a status of the read operations for a 512 bytes block from a NAND flash and its associated BCH parity bits, plus optionally spare area information. The ELM has the following features:

- 4-bit, 8-bit and 16-bit per 512byte block error location based on BCH algorithms
- Eight simultaneous processing contexts
- Page-based and continuous modes
- Interrupt generation on error location process completion
  - When the full page has been processed in page mode
  - For each syndrome polynomial in continuous mode

8.9 High-Definition Multimedia Interface (HDMI)

The device includes an HDMI 1.3a-compliant transmitter for digital video and audio data to display devices. The HDMI interface consists of a digital HDMI transmitter core with TMDS encoder, a core wrapper with interface logic and control registers, and a transmit PHY, with the following features:

- Hot-plug detection
- Consumer electronics control (CEC) messages
- DVI 1.0 compliant (only RGB pixel format)
- CEA 861-D and VESA DMT formats
- Supports up to 165-MHz pixel clock
  - 1920 x 1080p @75 Hz with 8-bit/component color depth
  - 1600 x 1200 @60 Hz with 8-bit/component color depth
- Support for deep-color mode:
  - 10-bit/component color depth up to 1080p @60 Hz (Max pixel clock = 148.5 MHz)
  - 12-bit/component color depth up to 720p/1080i @60 Hz (Max pixel clock = 123.75 MHz)
- TMDS clock to the HDMI-PHY is up to 185.625 MHz
- Maximum supported pixel clock:
  - 165 MHz for 8-bit color depth
  - 148.5 MHz for 10-bit color depth
  - 123.75 MHz for 12-bit color depth
- Uncompressed multichannel (up to eight channels) audio (L-PCM) support
- Master I2C interface for display data channel (DDC) connection

For more details on the HDMI, see the *High-Definition Multimedia Interface (HDMI)* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.9.1 HDMI Design Guidelines

This section provides PCB design and layout guidelines for the HDMI interface. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. Simulation and system design work has been done to ensure the HDMI interface requirements are met.

8.9.1.1 HDMI Interface Schematic

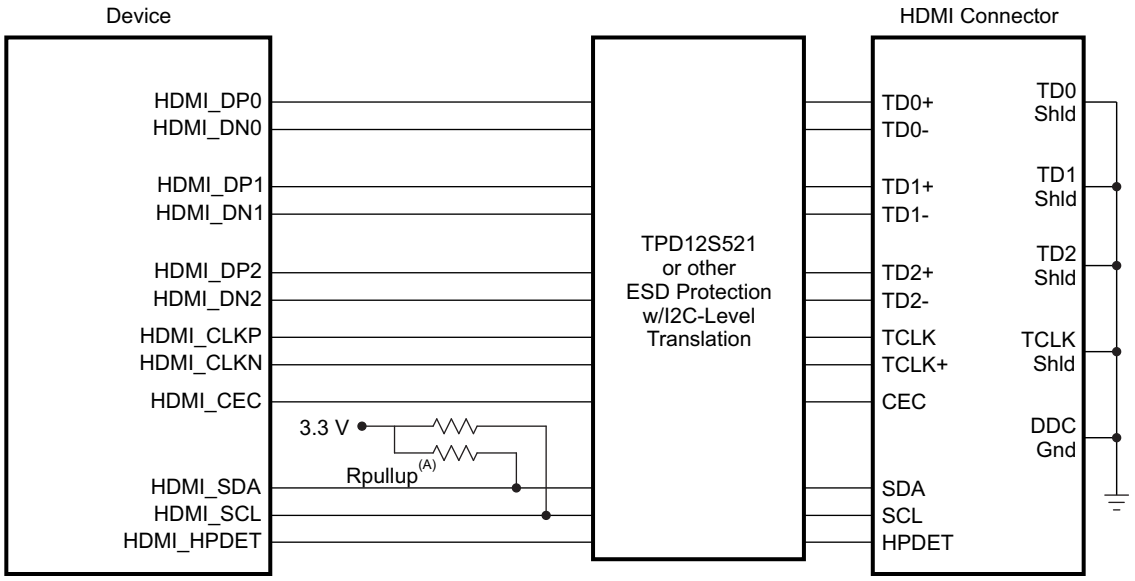
The HDMI bus is separated into three main sections:

1. Transition Minimized Differential Signaling (TMDS) high-speed digital video interface
2. Display Data Channel (I2C bus for configuration and status exchange between two devices)
3. Consumer Electronics Control (optional) for remote control of connected devices.

The DDC and CEC are low-speed interfaces, so nothing special is required for PCB layout of these signals. Their connection is shown in Figure 8-37, *HDMI Interface High-Level Schematic*.

The TMDS channels are high-speed differential pairs and, therefore, require the most care in layout. Specifications for TMDS layout are below.

Figure 8-37 shows the HDMI interface schematic. The specific pin numbers can be obtained from Table 3-15, *HDMI Terminal Functions*.



A. 5K-10K Ω pullup resistors are required if not integrated in the ESD protection chip.

Figure 8-37. HDMI Interface High-Level Schematic

8.9.1.2 TMDS Routing

The TMDS signals are high-speed differential pairs. Care must be taken in the PCB layout of these signals to ensure good signal integrity.

The TMDS differential signal traces must be routed to achieve 100 Ω (±10%) differential impedance and 60 Ω (±10%) single-ended impedance. Single-ended impedance control is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important.

These impedances are impacted by trace width, trace spacing, distance to reference planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs results in as close to 60 Ω impedance traces as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier, and trace width variations do not affect impedance as much; therefore, it is easier to maintain an accurate impedance over the length of the signal. The wider traces also show reduced skin effect and, therefore, often result in better signal integrity.

Table 8-40 shows the routing specifications for the TMDS signals.

Table 8-40. TMDS Routing Specifications

PARAMETER	MIN	TYP	MAX	UNIT
Processor-to-HDMI header trace length			7000	Mils
Number of stubs allowed on TMDS traces			0	Stubs
TX/RX pair differential impedance	90	100	110	Ω
TX/RX single ended impedance	54	60	66	Ω
Number of vias on each TMDS trace			2	Vias(1)

(1) Vias must be used in pairs with their distance minimized.

Table 8-40. TMDS Routing Specifications (continued)

PARAMETER	MIN	TYP	MAX	UNIT
TMDS differential pair to any other trace spacing	2*DS(2)			

(2) DS = differential spacing of the HDMI traces.

8.9.1.3 DDC Signals

As shown in Figure 8-37, *HDMI Interface High-Level Schematic*, the DDC connects just like a standard I2C bus. As such, resistor pullups must be used to pull up the open drain buffer signals unless they are integrated into the ESD protection chip used. If used, these pullup resistors should be connected to a 3.3-V supply.

8.9.1.4 HDMI ESD Protection Device (Required)

Interfaces that connect to a cable such as HDMI generally require more ESD protection than can be built into the outputs of the processor. Therefore, this HDMI interface requires the use of an ESD protection chip to provide adequate ESD protection and to translate I2C voltage levels from the 3.3 V supplied by the device to the 5 volts required by the HDMI specification.

When selecting an ESD protection chip, choose the lowest capacitance ESD protection available to minimize signal degradation. In no case should the ESD protection circuit capacitance be more than 5 pF.

TI manufactures devices that provide ESD protection for HDMI signals such as the TPD12S521. For more information see the www.ti.com website.

8.9.1.5 PCB Stackup Specifications

Table 8-41 shows the stackup and feature sizes required for HDMI.

Table 8-41. HDMI PCB Stackup Specifications

PARAMETER	MIN	TYP	MAX	UNIT
PCB routing/plane layers	4	6	-	Layers
Signal routing layers	2	3	-	Layers
Number of ground plane cuts allowed within HDMI routing region	-	-	0	Cuts
Number of layers between HDMI routing region and reference ground plane	-	-	0	Layers
PCB trace width	-	4	-	Mils
PCB BGA escape via pad size	-	20	-	Mils
PCB BGA escape via hole size	-	10		Mils
Processor device BGA pad size(1)(2)		0.4		mm

(1) Non-solder mask defined pad.
(2) Per IPC-7351A BGA pad size guideline.

8.9.1.6 Grounding

Each TMDS channel has its own shield pin which should be grounded to provide a return current path for the TMDS signal.

8.10 High-Definition Video Processing Subsystem (HDVPSS)

The device High-Definition Video Processing Subsystem (HDVPSS) provides a video input interface for external imaging peripherals (that is, image sensors, video decoders, and so on) and a video output interface for display devices, such as analog SDTV displays, digital HDTV displays, digital LCD panels, and so on. The HDVPSS includes HD and SD video encoders and an HDMI transmitter interface.

The device HDVPSS features include:

- Two display processing pipelines with de-interlacing, scaling, alpha blending, chroma keying, color space conversion, flicker filtering, and pixel format conversion.
- HD/SD compositor features for PIP support.
- Format conversions (up to 1080p 60 Hz) include scan format conversion, scan rate conversion, aspect-ratio conversion, and frame size conversion.
- Supports additional video processing capabilities by using the memory-to-memory feature of the subsystem.
- Two parallel video processing pipelines support HD (up to 1080p60) and SD (NTSC/PAL) simultaneous outputs.
  - SD analog output with OSD with embedded timing codes (BT.656)
    - S-video or Composite output
    - 2-channel SD-DAC with 10-bit resolution
    - Options available to support MacroVision and CGMS-A (contact local TI Sales rep for information).
  - Digital HDMI 1.3a-compliant transmitter (for details, see Section 8.9, *High-Definition Multimedia Interface (HDMI)*).
  - One digital video output supporting up to 30-bits @ 165 MHz
  - One digital video output supporting up to 24-bits @ 165 MHz
- Two independently configurable external video input capture ports (up to 165 MHz).
  - 16/24-bit HD digital video input or dual clock independent 8-bit SD inputs on each capture port.
  - 8/16/24-bit digital video input
  - 8-bit digital video input
  - Embedded sync and external sync modes are supported for all input configurations (VIN1 Port B supports embedded sync only).
  - De-multiplexing of both pixel-to-pixel and line-to-line multiplexed streams, effectively supporting up to 16 simultaneous SD inputs with a glueless interface to an external multiplexer such as the TVP5158.
  - Additional features include: programmable color space conversion, scaler and chroma downsampler, ancillary VANC/VBI data capture (decoded by software).
- Graphics features:
  - Three independently-generated graphics layers.
  - Each supports full-screen resolution graphics in HD, SD or both.
  - Up/down scaler optimized for graphics.
  - Global and pixel-level alpha blending supported.

For more detailed information on specific features and registers, see the *High Definition Video Processing Subsystem* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

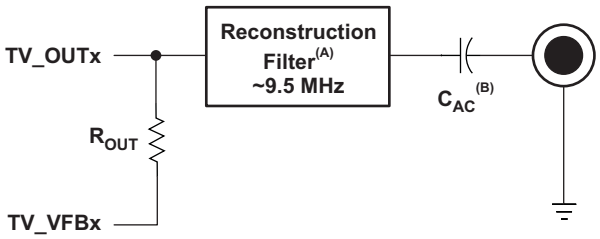
8.10.2 Video DAC Guidelines and Electrical Data/Timing

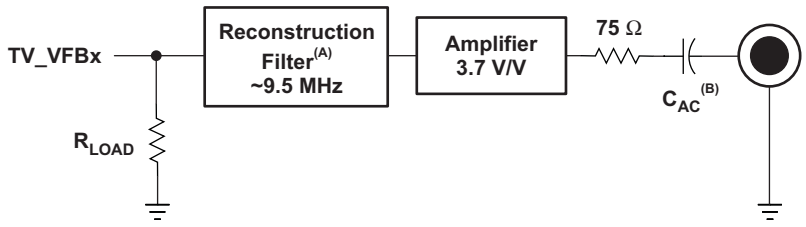
The analog video DAC outputs of the device can be operated in one of two modes: Normal mode and TVOUT Bypass mode. In Normal mode, the device's internal video amplifier is used. In TVOUT Bypass mode, the internal video amplifier is bypassed and an external amplifier is required.

Figure 8-41 shows a typical circuit that permits connecting the analog video output from the device to standard 75-Ω impedance video systems in Normal mode. Figure 8-42 shows a typical circuit that permits connecting the analog video output from the device to standard 75-Ω impedance video systems in TVOUT Bypass mode.



A. Reconstruction Filter (optional)
B. AC coupling capacitor (optional)

Figure 8-41. TV Output (Normal Mode)



A. Reconstruction Filter (optional). Note: An amplifier with an integrated reconstruction filter can alternatively be used instead of a discrete reconstruction filter.
B. AC coupling capacitor (optional)

Figure 8-42. TV Output (TVOUT Bypass Mode)

During board design, the onboard traces and parasitics must be matched for the channel. The video DAC output pins (TV_OUTx/TV_VFBx) are very high-frequency analog signals and must be routed with extreme care. As a result, the paths of these signals must be as short as possible, and as isolated as possible from other interfering signals. In TVOUT Bypass mode, the load resistor and amplifier/buffer should be placed as close as possible to the TV_VFBx pins. Other layout guidelines include:

- Take special care to bypass the VDDA_VDAC_1P8 power supply pin with a capacitor. For more information, see Section 7.2.9, *Power-Supply Decoupling*.
- In **TVOUT Bypass mode**, place the R_{LOAD} resistor as close as possible to the Reconstruction Filter and Amplifier. In addition, place the 75-Ω resistor as close as possible (< 0.5 ") to the Amplifier/buffer output pin. To maintain a high-quality video signal, the onboard traces after the 75-Ω resistor should have a characteristic impedance of 75 Ω (± 20%).
- In **Normal mode**, TV_VFBx is the most sensitive pin in the TV out system. The R_{OUT} resistor should be placed as close as possible to the device pins. To maintain a high-quality video signal, the onboard traces leading to the TV_OUTx pin should have a characteristic impedance of 75 Ω (± 20%) starting from the closest possible place to the device pin output.
- Minimize input trace lengths to the device to reduce parasitic capacitance.
- Include solid ground return paths.
- Match trace lengths as close as possible within a video format group (that is, Y and C for S-Video output should match each other).

For additional Video DAC Design guidelines, see the *High Definition Video Processing Subsystem* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

Table 8-44. Static and Dynamic DAC Specifications

VDAC STATIC SPECIFICATIONS					
PARAMETER	**TEST CONDITIONS**	**MIN**	**TYP**	**MAX**	**UNIT**
Reference Current Setting Resistor (R_{SET})	Normal Mode	4653	4700	4747	Ω

8.11 Inter-Integrated Circuit (I2C)

The device includes four inter-integrated circuit (I2C) modules which provide an interface to other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus™) specification version 2.1. External components attached to this 2-wire serial bus can transmit/receive 8-bit data to/from the device through the I2C module. The I2C port *does not* support CBUS compatible devices.

The I2C port supports the following features:

- Compatible with Philips I2C Specification Revision 2.1 (January 2000)
- Standard and fast modes from 10 - 400 Kbps (no fail-safe I/O buffers)
- Noise filter to remove noise 50 ns or less
- Seven- and ten-bit device addressing modes
- Multimaster transmitter/slave receiver mode
- Multimaster receiver/slave transmitter mode
- Combined master transmit/receive and receive/transmit modes
- Two DMA channels, one interrupt line
- Built-in FIFO (32 byte) for buffered read or write.

For more detailed information on the I2C peripheral, see the *Inter-Integrated Circuit (I2C) Controller Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

13	$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		µs
14	$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
15	C_b (5)	Capacitive load for each bus line		400		400	pF

(1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
(2) A Fast-mode I²C-bus™ device can be used in a Standard-mode I²C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq$ 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line t_r max + $t_{su(SDA-SCLH)}$ = 1000 + 250 = 1250 ns (according to the Standard-mode I²C-Bus Specification) before the SCL line is released.
(3) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
(4) The maximum $t_{h(SDA-SCLL)}$ has only to be met if the device does not stretch the low period [$t_{w(SCLL)}$] of the SCL signal.
(5) C_b = total capacitance of one bus line in pF. If mixed with HS-mode devices, faster fall-times are allowed.

8.12 Imaging Subsystem (ISS)

The device Imaging Subsystem captures and processes pixel data from external image and video inputs. The inputs can be connected to the Image Processing block through the Parallel Camera Interface (CAM). . In addition, a Timing control module provides flash strobe and mechanical shutter interfaces. The features of each component of the ISS are described below.

- Parallel Camera (CAM) interface features:
  - Input format
    - Bayer pattern Raw (up to 16bit) or YCbCr 422 (8bit or 16bit) data.
    - ITU-R BT.656/1120 standard format
  - Generates HD/VD timing signals and field ID to an external timing generator, or can synchronize to the external timing generator.
  - Support for progressive and interlaced sensors (hardware support for up to 2 fields and firmware supports for higher number of fields, typically 3-, 4-, and 5-field sensors.
- Image Sensor Interface (ISIF) features:
  - Support for up to 32K pixels (image size) in both the horizontal and vertical direction
  - Color space conversion for non-Bayer pattern Raw data
  - Digital black clamping with Horizontal/Vertical offset drift compensation
  - Vertical Line defect correction based on a lookup table
  - Color-dependent gain control and black level offset control
  - Ability to control output to the DDR2/DDR3 via an external write enable signal
  - Down sampling via programmable culling patterns
  - A-law/DPCM compression
  - Generating 16-, 12- or 8-bit output to memory
- Two independent Resizers
  - Providing two different sizes of outputs simultaneously on one input
  - Maximum line width is 5376 and 2336, respectively
  - YUV422 to YUV420 conversion
  - Data output format: RGB565, ARGB888, YUV422 co sited and YUV4:2:0 planar
  - Resizer Ratio: x1/4096 approximately x20
  - Input from memory
- Timing control module features:
  - STROBE signal for flash pre-strobe and flash strobe
  - SHUTTER signal for mechanical shutter control
  - Global reset control

For more detailed information on the ISS, see the ISS Overview section, the ISS Interfaces section, and the ISS ISP section of the *Watchdog Timer* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.13 DDR2/DDR3 Memory Controller

The device has a dedicated interface to DDR3 and DDR2 SDRAM. The device dedicated interface also supports JEDEC standard compliant DDR2 and DDR3 SDRAM devices with the following features:

- 16-bit or 32-bit data path to external SDRAM memory
- Memory device capacity: 64Mb, 128Mb, 256Mb, 512Mb, 1Gb, 2Gb, and 4Gb devices
- Support for two independent chip selects, with their corresponding register sets, and independent page tracking
- Two interfaces with associated DDR2/DDR3 PHYs
- Dynamic memory manager allows for interleaving of data between the two DDR interfaces.

For details on the DDR2/DDR3 Memory Controller, see the *DDR2/DDR3 Memory Controller* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.13.4 DDR2/DDR3 Memory Controller Electrical Data/Timing

TI only supports board designs that follow the DDR2 and DDR3 Routing Specifications outlined in this document. The switching characteristics and the timing diagram for the DDR2 memory controller are shown in Table 8-53 and Figure 8-46.

Table 8-53. Switching Characteristics Over Recommended Operating Conditions for DDR2/DDR3 Memory Controller (1)

NO.				OPP100/120/166		UNIT
				MIN	MAX	
1	$t_{c(DDR\_CLK)}$	Cycle time, DDR[x]_CLK	DDR2 mode	2.5		ns
			DDR3 mode	1.876		

(1) The PLL_DDR Controller *must* be programmed such that the resulting DDR[x]_CLK clock frequency is within the specified range.

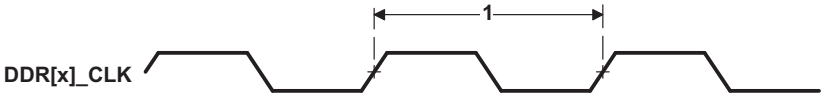

Figure 8-46. DDR2/DDR3 Memory Controller Clock Timing

8.13.4.1 DDR2 Routing Specifications

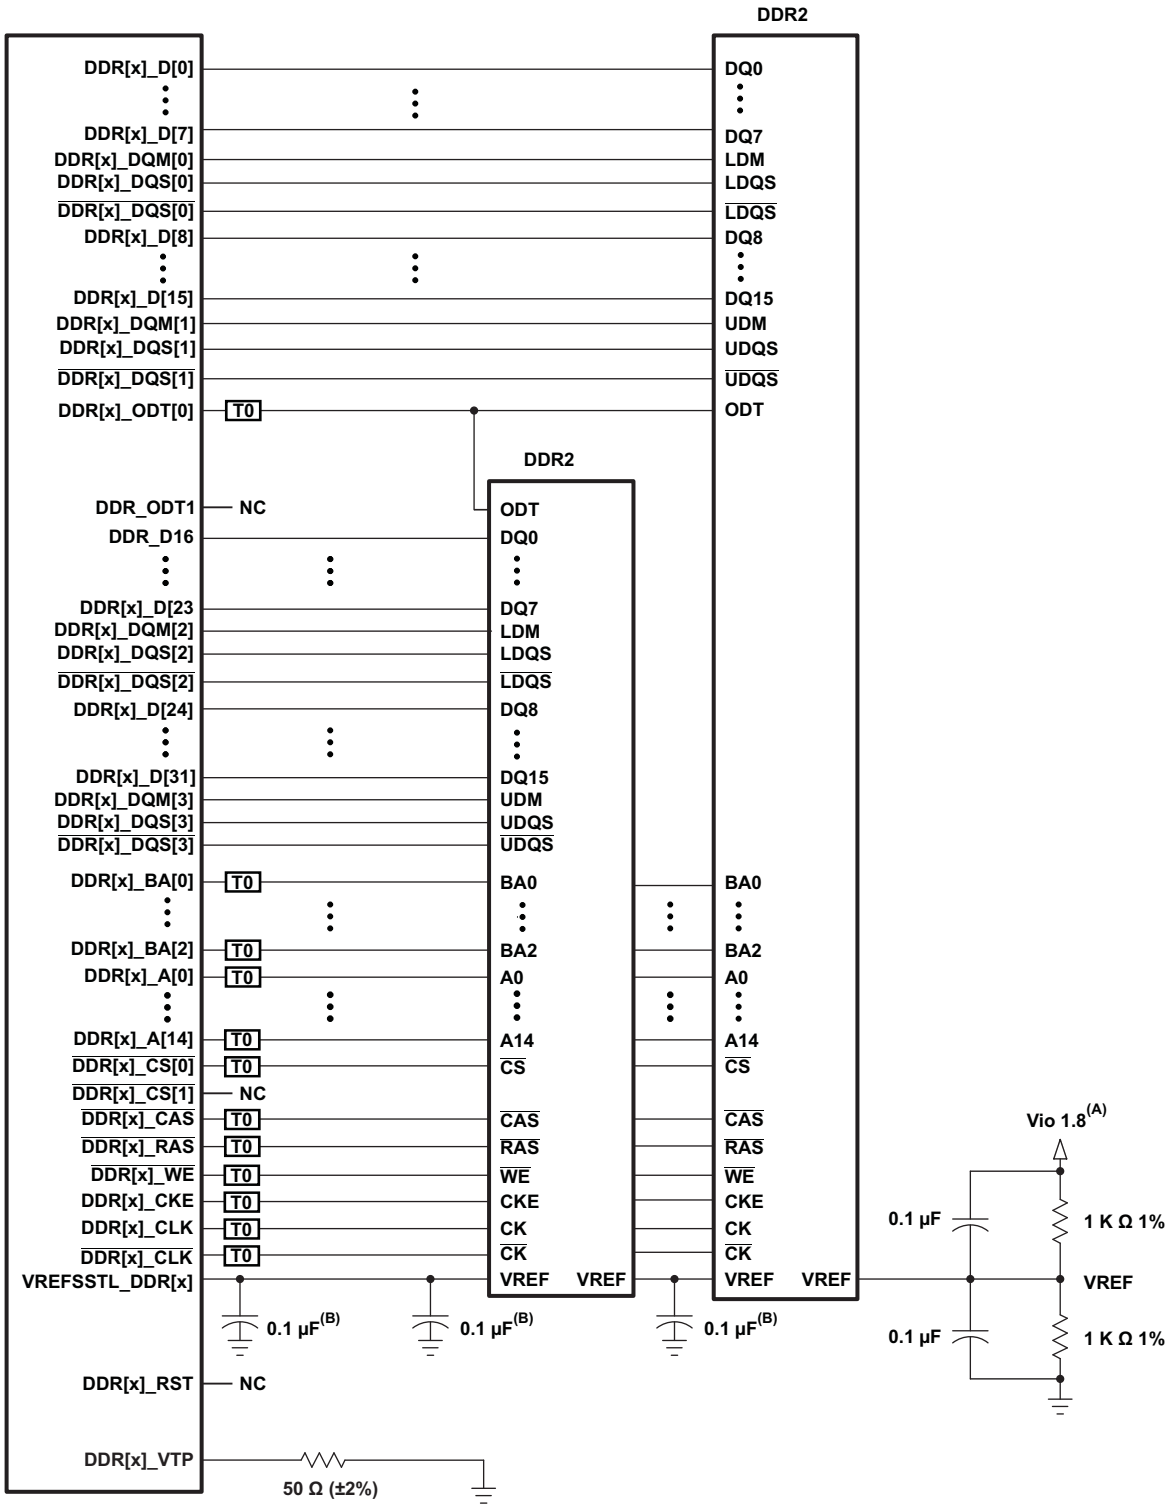
8.13.4.1.1 DDR2 Interface

This section provides the timing specification for the DDR2 interface as a PCB design and manufacturing specification. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. These rules, when followed, result in a reliable DDR2 memory system without the need for a complex timing closure process. For more information regarding the guidelines for using this DDR2 specification, see the *Understanding TI's PCB Routing Rule-Based DDR Timing Specification* Application Report (Literature Number: SPRAAV0).

8.13.4.1.1.1 DDR2 Interface Schematic

Figure 8-47 shows the DDR2 interface schematic for a x32 DDR2 memory system. In Figure 8-48 the x16 DDR2 system schematic is identical except that the high-word DDR2 device is deleted.

When not using all or part of a DDR2 interface, the proper method of handling the unused pins is to tie off the DDR[x]_DQS[n] pins to the corresponding DVDD_DDR[x] supply via a 1k-Ω resistor and pulling the DDR[x]_DQS[n] pins to ground via a 1k-Ω resistor. This needs to be done for each byte not used. Also, include the 50-Ω pulldown for DDR[x]_VTP. The DVDD_DDR[x] and VREFSSTL_DDR[x] power supply pins need to be connected to their respective power supplies even if DDR[x] is not being used. All other DDR interface pins can be left unconnected. Note that the supported modes for use of the DDR EMIF are 32-bits wide, 16-bits wide, or not used.

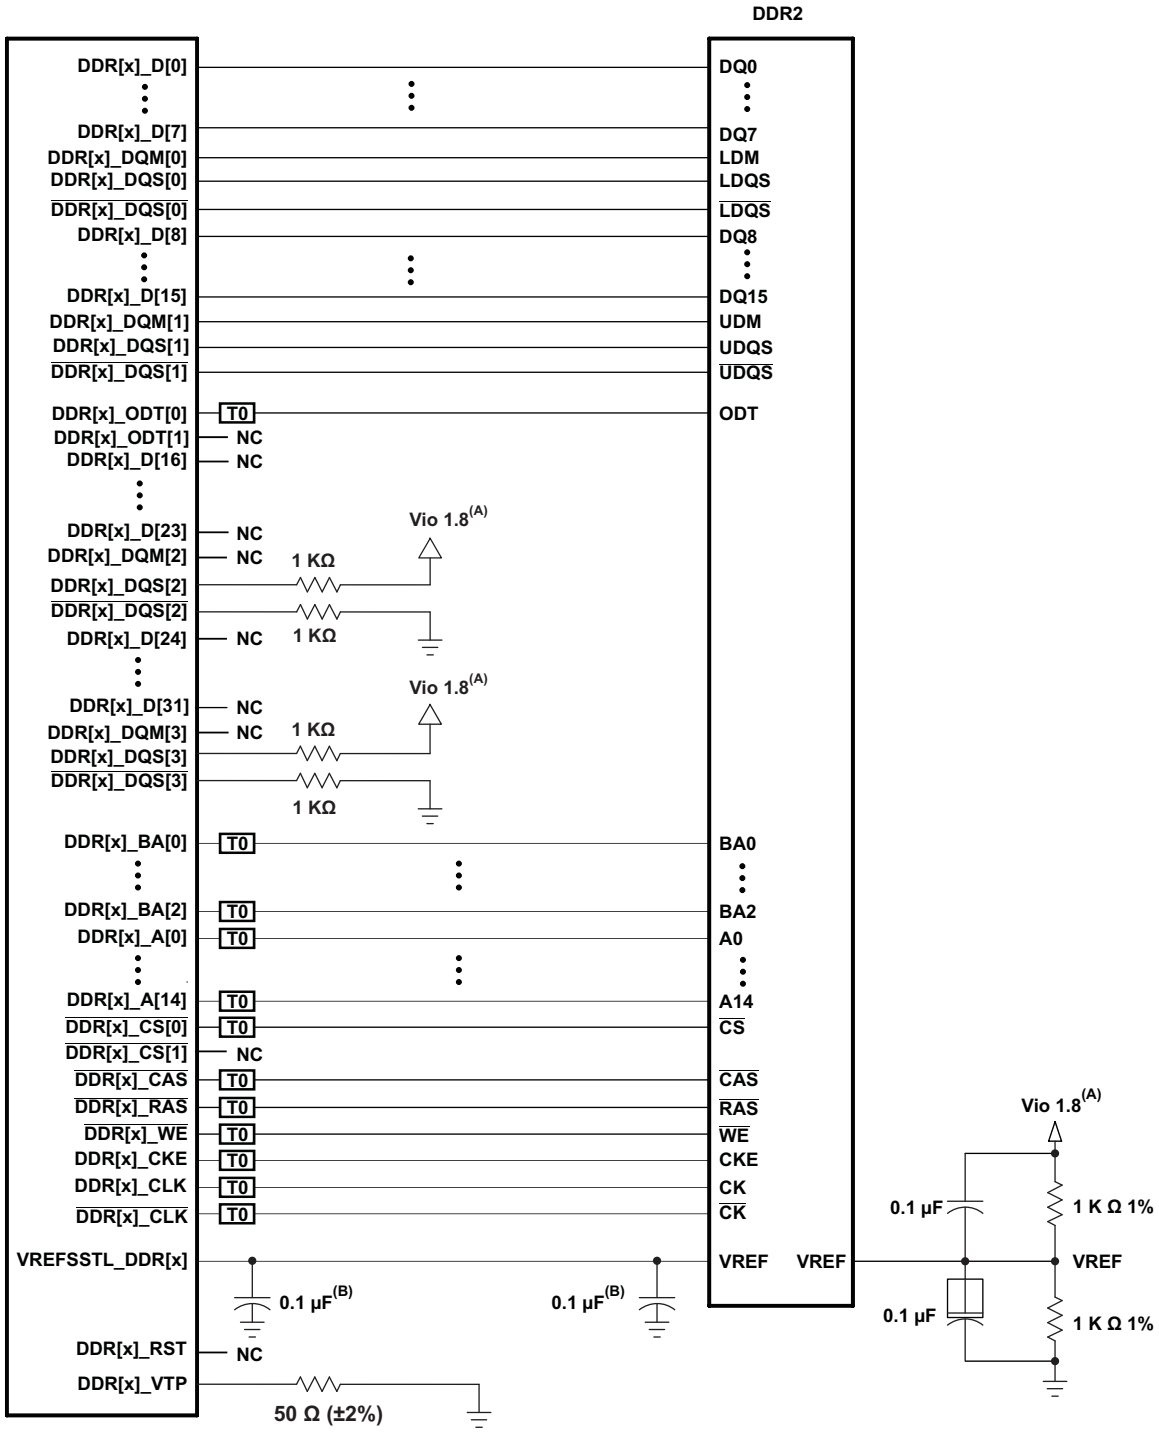


T0 Termination is required. See terminator comments.

A. Vio1.8 is the power supply for the DDR2 memories and the DM814x DDR2 interface.

B. One of these capacitors can be eliminated if the divider and its capacitors are placed near a VREF pin.

Figure 8-47. 32-Bit DDR2 High-Level Schematic



T0 Termination is required. See terminator comments.

A. Vio1.8 is the power supply for the DDR2 memories and the DM814x DDR2 interface.

B. One of these capacitors can be eliminated if the divider and its capacitors are placed near a VREF pin.

Figure 8-48. 16-Bit DDR2 High-Level Schematic

8.13.4.1.1.2 Compatible JEDEC DDR2 Devices

Table 8-54 shows the parameters of the JEDEC DDR2 devices that are compatible with this interface. Generally, the DDR2 interface is compatible with x16 DDR2-800 speed grade DDR2 devices.

Table 8-54. Compatible JEDEC DDR2 Devices (Per Interface)

NO.	PARAMETER	MIN	MAX	UNIT
1	JEDEC DDR2 device speed grade(1)	DDR2-800		
2	JEDEC DDR2 device bit width	x16	x16	Bits
3	JEDEC DDR2 device count(2)	1	2	Devices
4	JEDEC DDR2 device ball count(3)	84	92	Balls

(1) Higher DDR2 speed grades are supported due to inherent JEDEC DDR2 backwards compatibility.
(2) One DDR2 device is used for a 16-bit DDR2 memory system. Two DDR2 devices are used for a 32-bit DDR2 memory system.
(3) The 92-ball devices are retained for legacy support. New designs will migrate to 84-ball DDR2 devices. Electrically, the 92- and 84-ball DDR2 devices are the same.

8.13.4.1.1.3 PCB Stackup

The minimum stackup required for routing the DM814x device is a six-layer stackup as shown in Table 8-55. Additional layers may be added to the PCB stackup to accommodate other circuitry or to reduce the size of the PCB footprint.

Table 8-55. Minimum PCB Stackup

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly horizontal
2	Plane	Ground
3	Plane	Power
4	Signal	Internal routing
5	Plane	Ground
6	Signal	Bottom routing mostly vertical

Complete stackup specifications are provided in Table 8-56.

Table 8-56. PCB Stackup Specifications

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	PCB routing/plane layers	6			
2	Signal routing layers	3			
3	Full ground layers under DDR2 routing region	2			
4	Number of ground plane cuts allowed within DDR routing region			0	
5	Number of ground reference planes required for each DDR2 routing layer	1			
6	Number of layers between DDR2 routing layer and reference ground plane			0	
7	PCB routing feature size		4		Mils
8	PCB trace width, w		4		Mils
9	PCB BGA escape via pad size(1)		18	20	Mils
10	PCB BGA escape via hole size(1)		10		Mils
11	Processor BGA pad size		0.4		mm
13	Single-ended impedance, Zo	50		75	Ω
14	Impedance control(2)	Z-5	Z	Z+5	Ω

(1) A 20/10 via may be used if enough power routing resources are available. An 18/10 via allows for more flexible power routing to the processor.
(2) Z is the nominal singled-ended impedance selected for the PCB specified by item 13.

8.13.4.1.1.4 Placement

Figure 8-49 shows the required placement for the processor as well as the DDR2 devices. The dimensions for this figure are defined in Table 8-57. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR2 device is omitted from the placement.

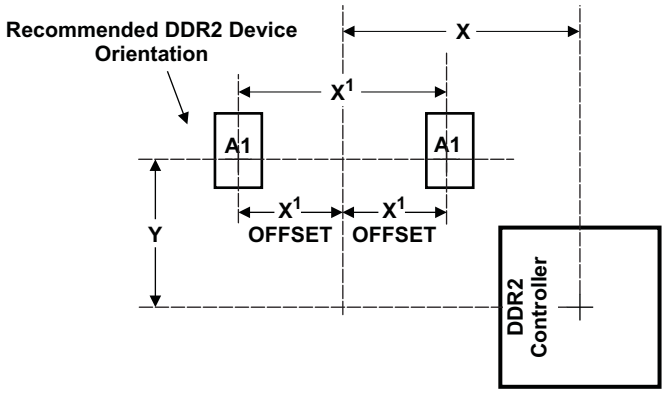


Figure 8-49. DM814x Device and DDR2 Device Placement

Table 8-57. Placement Specifications

NO.	PARAMETER	MIN	MAX	UNIT
1	X + Y (1) (2)		1660	Mils
2	X' (1) (2)		1280	Mils
3	X' Offset (1) (2) (3)		650	Mils
4	DDR2 keepout region (4)			
5	Clearance from non-DDR2 signal to DDR2 keepout region (5)	4		w

(1) For dimension definitions, see Figure 8-47.
(2) Measurements from center of processor to center of DDR2 device.
(3) For 16-bit memory systems, it is recommended that X' offset be as small as possible.
(4) DDR2 keepout region to encompass entire DDR2 routing area.
(5) Non-DDR2 signals allowed within DDR2 keepout region provided they are separated from DDR2 routing layers by a ground plane.

8.13.4.1.1.5 DDR2 Keepout Region

The region of the PCB used for the DDR2 circuitry must be isolated from other signals. The DDR2 keepout region is defined for this purpose and is shown in Figure 8-50. The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in Table 8-57.

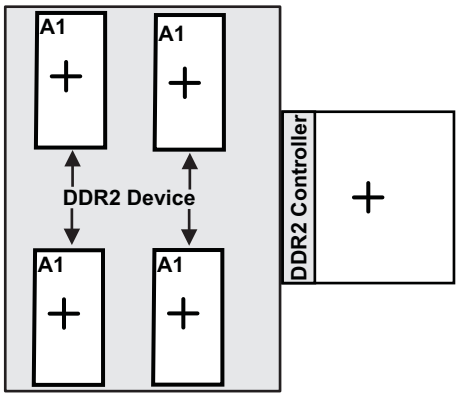

Figure 8-50. DDR2 Keepout Region

NOTE

The region shown in should encompass all the DDR2 circuitry and varies depending on placement. Non-DDR2 signals should not be routed on the DDR signal layers within the DDR2 keepout region. Non-DDR2 signals may be routed in the region, provided t hey are routed on layers separated from DDR2 signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.8-V power plane should cover the entire keepout region. Routes for the two DDR interfaces must be separated by at least 4x; the more separation, the better.

8.13.4.1.1.6 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR2 and other circuitry. Table 8-58 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR2 interfaces and DDR2 device. Additional bulk bypass capacitance may be needed for other circuitry.

Table 8-58. Bulk Bypass Capacitors

No.	Parameter	Min	Max	Unit
1	DVDD18 bulk bypass capacitor count(1)	6		Devices
2	DVDD18 bulk bypass total capacitance	60		µF
3	DDR#1 bulk bypass capacitor count(1)	1		Devices
4	DDR#1 bulk bypass total capacitance(1)	10		µF
5	DDR#2 bulk bypass capacitor count(2)	1		Devices
6	DDR#2 bulk bypass total capacitance(1)(2)	10		µF

(1) These devices should be placed near the device they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors. Use half of these capacitors for DDR[0] and half for DDR[1].
(2) Only used on 32-bit wide DDR2 memory systems.

8.13.4.1.1.7 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR2 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, processor/DDR power, and processor/DDR ground connections. Table 8-59 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB.

Table 8-59. High-Speed Bypass Capacitors

NO.	PARAMETER	MIN	MAX	UNIT
1	HS bypass capacitor package size(1)		0402	10 Mils
2	Distance from HS bypass capacitor to device being bypassed		250	Mils
3	Number of connection vias for each HS bypass capacitor(2)	2		Vias
4	Trace length from bypass capacitor contact to connection via	1	30	Mils
5	Number of connection vias for each processor power/ground ball	1		Vias
6	Trace length from processor power/ground ball to connection via		35	Mils
7	Number of connection vias for each DDR2 device power/ground ball	1		Vias
8	Trace length from DDR2 device power/ground ball to connection via		35	Mils
9	DVDD18 HS bypass capacitor count(3)(4)	40		Devices
10	DVDD18 HS bypass capacitor total capacitance(5)	2.4		µF
11	DDR device HS bypass capacitor count(6)(7)	8		Devices
12	DDR device HS bypass capacitor total capacitance(7)	0.4		µF

(1) LxW, 10-mil units, that is, a 0402 is a 40x20-mil surface-mount capacitor.
(2) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board.
(3) These devices should be placed as close as possible to the device being bypassed.
(4) Use half of these capacitors for DDR[0] and half for DDR[1].
(5) Use half of these capacitors for DDR[0] and half for DDR[1].
(6) These devices should be placed as close as possible to the device being bypassed.
(7) Per DDR device.

8.13.4.1.1.8 Net Classes

Table 8-60 lists the clock net classes for the DDR2 interface. Table 8-61 lists the signal net classes, and associated clock net classes, for the signals in the DDR2 interface. These net classes are used for the termination and routing rules that follow.

Table 8-60. Clock Net Class Definitions

CLOCK NET CLASS	PROCESSOR PIN NAMES
CK	DDR[x]_CLK/$\overline{\text{DDR[x]\_CLK}}$
DQS0	DDR[x]_DQS[0]/$\overline{\text{DDR[x]\_DQS[0]}}$
DQS1	DDR[x]_DQS[1]/$\overline{\text{DDR[x]\_DQS[1]}}$
DQS2(1)	DDR[x]_DQS[2]/$\overline{\text{DDR[x]\_DQS[2]}}$
DQS3(1)	DDR[x]_DQS[3]/$\overline{\text{DDR[x]\_DQS[3]}}$

(1) Only used on 32-bit wide DDR2 memory systems.

Table 8-61. Signal Net Class Definitions

CLOCK NET CLASS	ASSOCIATED CLOCK NET CLASS	PROCESSOR PIN NAMES
ADDR_CTRL	CK	DDR[x]_BA[2:0], DDR[x]_A[14:0], DDR[x]_CS[x], DDR[x]_CAS, DDR[x]_RAS, DDR[x]_WE, DDR[x]_CKE, DDR[x]_ODT[x]
DQ0	DQS0	DDR[x]_D[7:0], DDR[x]_DQM[0]
DQ1	DQS1	DDR[x]_D[15:8], DDR[x]_DQM[1]
DQ2(1)	DQS2	DDR[x]_D[23:16], DDR[x]_DQM[2]
DQ3(1)	DQS3	DDR[x]_D[31:24], DDR[x]_DQM[3]

(1) Only used on 32-bit wide DDR2 memory systems.

8.13.4.1.1.9 DDR2 Signal Termination

Signal terminators are required in CK and ADDR_CTRL net classes. Serial terminators may be used on data lines to reduce EMI risk; however, serial terminations are the only type permitted. ODTs are integrated on the data byte net classes. They should be enabled to ensure signal integrity.Table 8-62 shows the specifications for the series terminators.

Table 8-62. DDR2 Signal Terminations

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	CK net class(1)(2)	0		10	Ω
2	ADDR_CTRL net class(1) (2)(3)(4)	0	22	Zo	Ω
3	Data byte net classes (DQS0-DQS3, DQ0-DQ3)(5)	0		Zo	Ω

(1) Only series termination is permitted, parallel or SST specifically disallowed on board.
(2) Only required for EMI reduction.
(3) Terminator values larger than typical only recommended to address EMI issues.
(4) Termination value should be uniform across net class.
(5) No external terminations allowed for data byte net classes. ODT is to be used.

8.13.4.1.1.10 VREFSSTL_DDR Routing

VREFSSTL_DDR is used as a reference by the input buffers of the DDR2 memories as well as the processor. VREF is intended to be half the DDR2 power supply voltage and should be created using a resistive divider as shown in Figure 8-48. Other methods of creating VREF are not recommended. Figure 8-51 shows the layout guidelines for VREF.

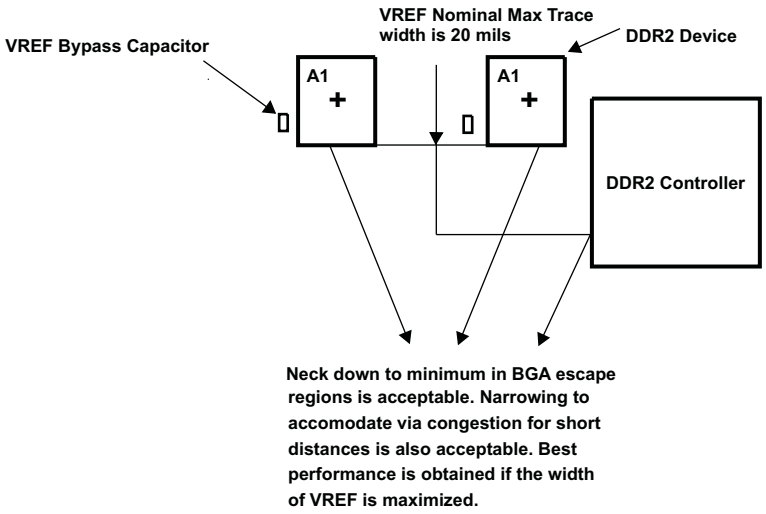

Figure 8-51. VREF Routing and Topology

8.13.4.1.2 DDR2 CK and ADDR_CTRL Routing

Figure 8-52 shows the topology of the routing for the CK and ADDR_CTRL net classes. The route is a balanced *T* as it is intended that the length of segments B and C be equal. In addition, the length of A (A'+A") should be maximized.

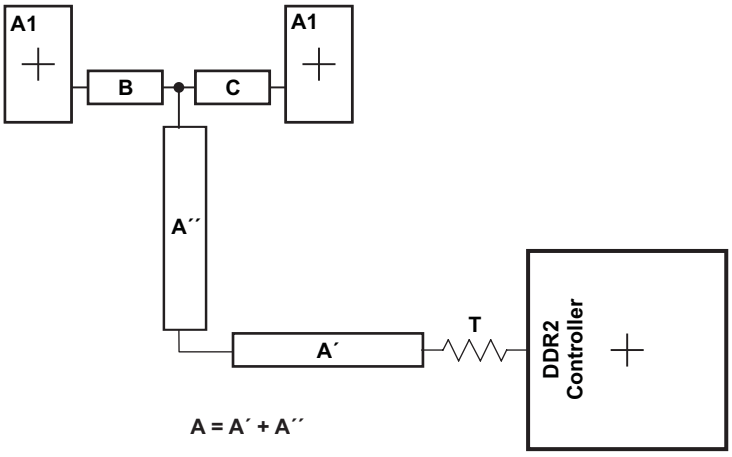

Figure 8-52. CK and ADDR_CTRL Routing and Topology

Table 8-63. CK and ADDR_CTRL Routing Specification (1)

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	Center-to-center CK-$\overline{CK}$ spacing			2w	
2	CK/$\overline{CK}$ skew(1)			25	Mils
3	CK A-to-B/A-to-C skew length mismatch(2)			25	Mils
4	CK B-to-C skew length mismatch			25	Mils
5	Center-to-center CK to other DDR2 trace spacing(3)	4w			
6	CK/ADDR_CTRL nominal trace length(4)	CACLM-50	CACLM	CACLM+50	Mils
7	ADDR_CTRL-to-CK skew length mismatch			100	Mils
8	ADDR_CTRL-to-ADDR_CTRL skew length mismatch			100	Mils
9	Center-to-center ADDR_CTRL to other DDR2 trace spacing(3)	4w			
10	Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing(3)	3w			
11	ADDR_CTRL A-to-B/A-to-C skew length mismatch(2)			100	Mils
12	ADDR_CTRL B-to-C skew length mismatch			100	Mils

(1) The length of segment A = A' + A″ as shown in Figure 8-52.
(2) Series terminator, if used, should be located closest to the processor.
(3) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
(4) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes.

Figure 8-53 shows the topology and routing for the DQS and DQ net classes; the routes are point to point. Skew matching across bytes is not needed nor recommended.

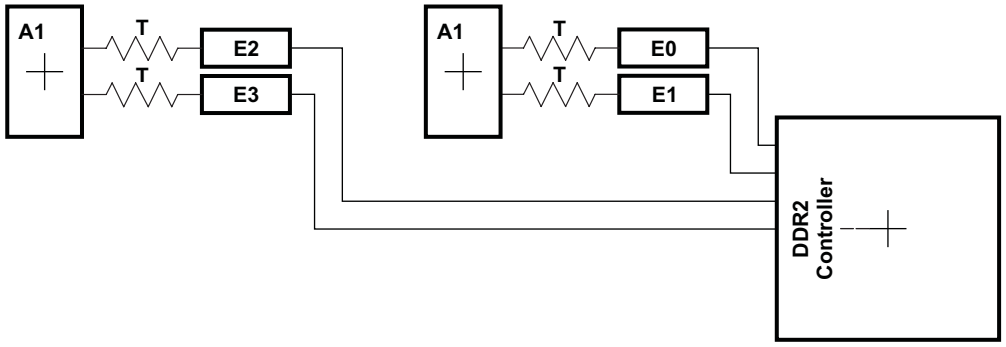

Figure 8-53. DQS and DQ Routing and Topology

Table 8-64. DQS and DQ Routing Specification

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	Center-to-center DQS-DQSn spacing in E0|E1|E2|E3			2w	
2	DQS-DQSn skew in E0|E1|E2|E3			25	Mils
3	Center-to-center DQS to other DDR2 trace spacing(1)	4w			
4	DQS/DQ nominal trace length (2)(3)(4)	DQLM-50	DQLM	DQLM+50	Mils
5	DQ-to-DQS skew length mismatch(2)(3)(4)			100	Mils
6	DQ-to-DQ skew length mismatch(2)(3)(4)			100	Mils
7	DQ-to-DQ/DQS via count mismatch(2)(3)(4)			1	Vias
8	Center-to-center DQ to other DDR2 trace spacing(1)(5)	4w			
9	Center-to-center DQ to other DQ trace spacing(1)(6)(7)	3w			
10	DQ/DQS E skew length mismatch(2)(3)(4)			100	Mils

(1) Center-to-center spacing is allowed to fall to minimum (w) for up to 500 mils of routed length to accommodate BGA escape and routing congestion.
(2) A 16-bit DDR memory system has two sets of data net classes; one for data byte 0, and one for data byte 1, each with an associated DQS (2 DQSs) per DDR EMIF used.
(3) A 32-bit DDR memory system has four sets of data net classes; one each for data bytes 0 through 3, and each associated with a DQS (4 DQSs) per DDR EMIF used.
(4) There is no need, and it is not recommended, to skew match across data bytes; that is, from DQS0 and data byte 0 to DQS1 and data byte 1.
(5) DQs from other DQS domains are considered *other DDR2 trace*.
(6) DQs from other data bytes are considered *other DDR2 trace*.
(7) DQLM is the longest Manhattan distance of each of the DQS and DQ net classes.

8.13.4.2 DDR3 Routing Specifications

8.13.4.2.1 DDR3 versus DDR2

This specification only covers PCB designs that utilize DDR3 memory. PCB designs using other types of DDR memory should follow the specification appropriate for that type of memory. It is currently not possible to design a single PCB that supports multiple types of DDR memory.

8.13.4.2.2 DDR3 EMIFs

A processor may contain more than one EMIF. This specification covers only one EMIF and needs to be implemented for each additional EMIF. Requirements are identical between the EMIFs, however, the PCB layouts will most likely be different.

8.13.4.2.3 DDR3 Device Combinations

Since there are several possible combinations of device counts and single- or dual-side mounting, Table 8-65 summarizes the supported device configurations.

Table 8-65. Supported DDR3 Device Combinations(1)

NUMBER OF DDR3 DEVICES	DDR3 DEVICE WIDTH (BITS)	MIRRORED?	DDR3 EMIF WIDTH (BITS)
1	16	N	16
2	8	Y(2)	16
2	16	N	32
2	16	Y(2)	32
4	8	N	32
4	8	Y(3)	32

(1) This table is per EMIF.
(2) Two DDR3 devices are mirrored when one device is placed on the top of the board and the second device is placed on the bottom of the board.
(3) This is two mirrored pairs of DDR3 devices.

8.13.4.2.4 DDR3 Interface Schematic

The DDR3 interface schematic varies, depending upon the width of the DDR3 devices used and the width of the bus used (16 or 32 bits). General connectivity is straightforward and very similar. 16-bit DDR devices look like two 8-bit devices. Figure 8-54 and Figure 8-55 show the schematic connections for 32-bit interfaces using x16 and x8 devices.

Note that a 16-bit wide interface schematic is practically identical to the 32-bit interface; only the high-word DDR memories are removed.

When not using all or part of a DDR3 interface, the proper method of handling the unused pins is to tie off the DDR[x]_DQS[n] pins to the corresponding DVDD_DDR[x] supply via a 1-kΩ resistor and pulling the $\overline{\text{DDR[x]\_DQS[n]}}$ pins to ground via a 1k-Ω resistor. This needs to be done for each byte not used. Although these signals have internal pullups and pulldowns, external pullups and pulldowns provide additional protection against external electrical noise causing activity on the signals.Also, include the 50-Ω pulldown for DDR[x]_VTP. The DVDD_DDR[x] and VREFSSTL_DDR[x] power supply pins need to be connected to their respective power supplies even if DDR[x] is not being used. All other DDR interface pins can be left unconnected. Note that the supported modes for use of the DDR EMIF are 32 bits wide, 16 bits wide, or not used.

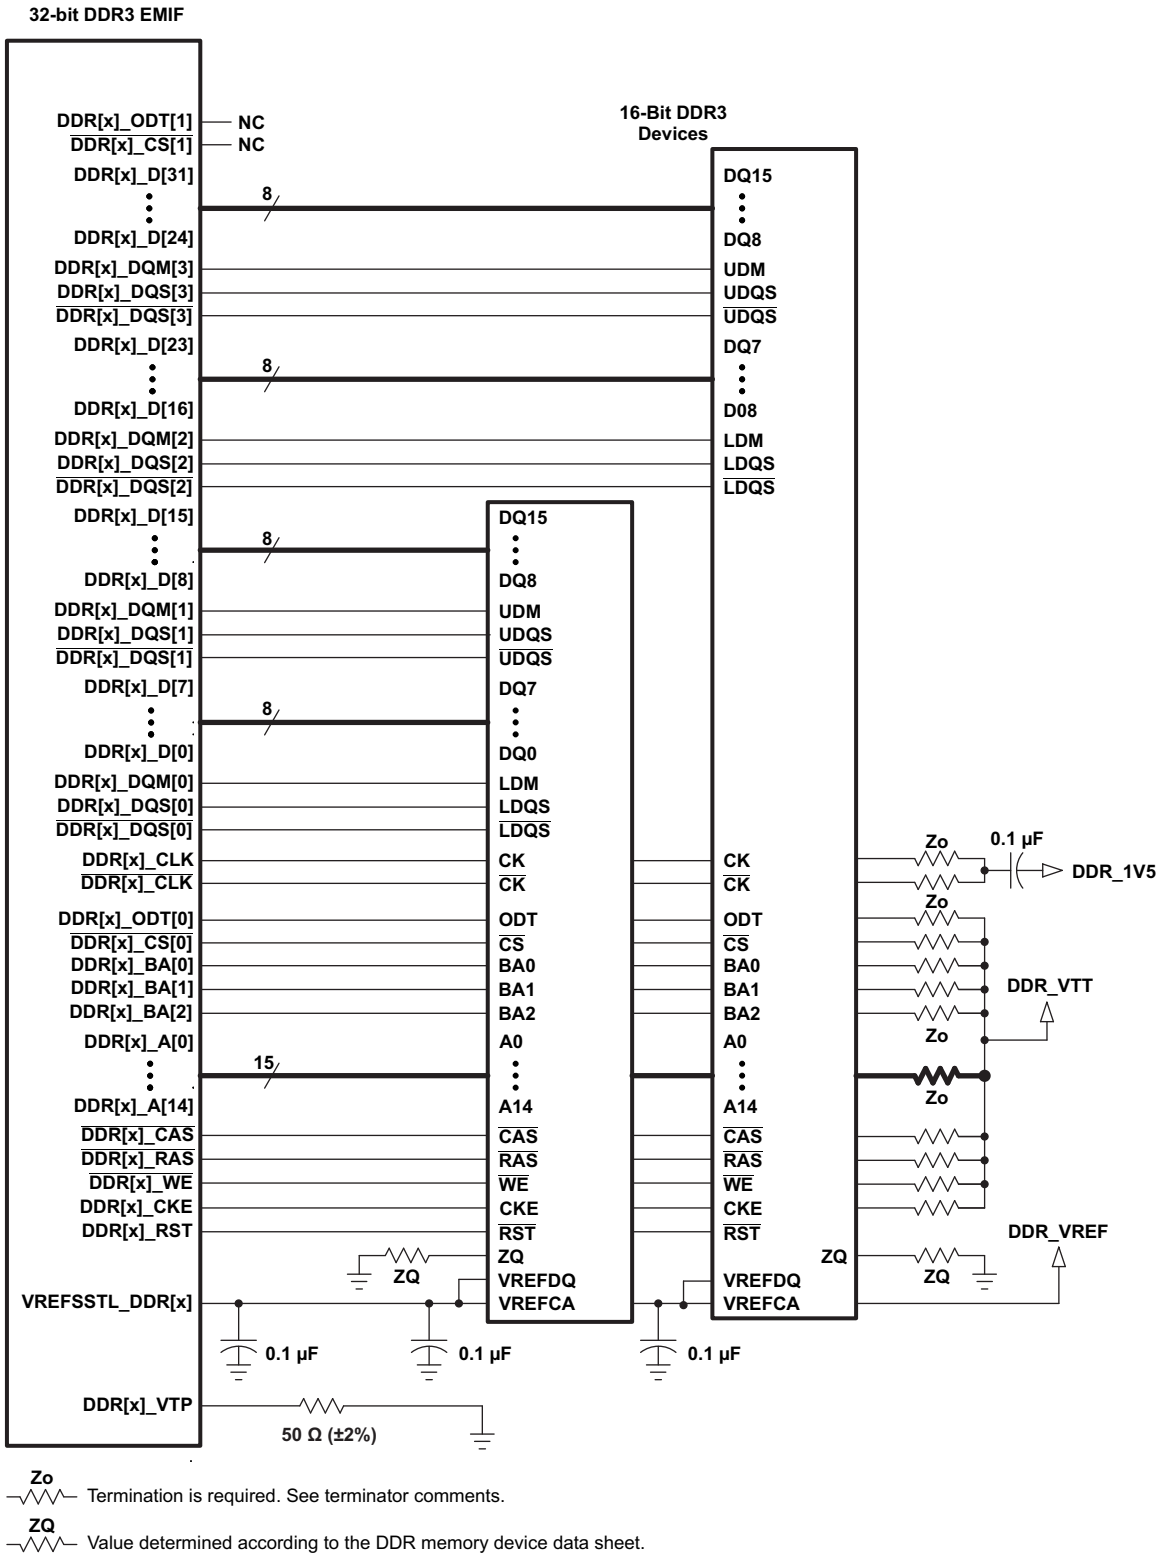

Figure 8-54. 32-Bit, One-Bank DDR3 Interface Schematic Using Two 16-Bit DDR3 Devices

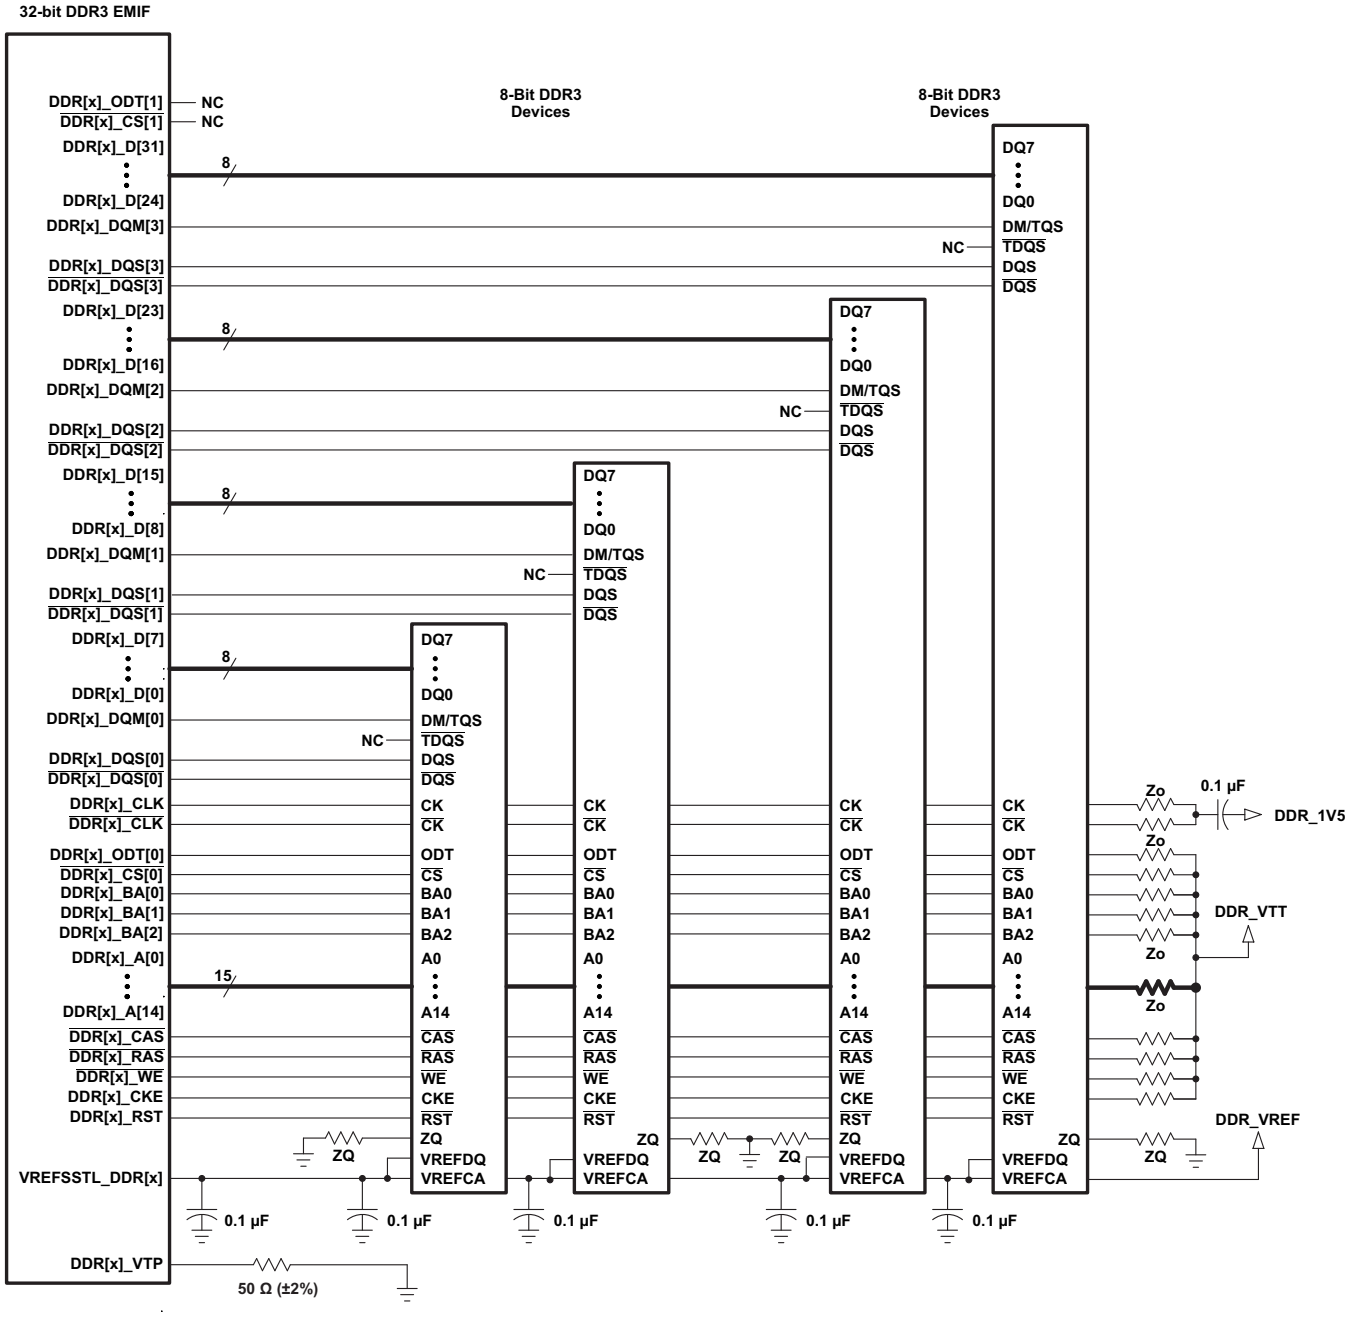

Figure 8-55. 32-Bit, One-Bank DDR3 Interface Schematic Using Four 8-Bit DDR3 Devices

8.13.4.2.4.1 Compatible JEDEC DDR3 Devices

Table 8-66 shows the parameters of the JEDEC DDR3 devices that are compatible with this interface. Generally, the DDR3 interface is compatible with DDR3-1600 devices in the x8 or x16 widths.

Table 8-66. Compatible JEDEC DDR3 Devices (Per Interface)

NO.	PARAMETER	MIN	MAX	UNIT
1	JEDEC DDR3 device speed grade(1)	DDR3-800	DDR3-1600(2)	
2	JEDEC DDR3 device bit width	x8	x16	Bits
3	JEDEC DDR3 device count(3)	2	8	Devices

(1) DDR3 speed grade depends on desired clock rate. Data rate is 2x the clock rate. For DDR3-800, the clock rate is 400 MHz.
(2) DDR3 devices with speed grades up to DDR3-1600 are supported; however, max clock rate will still be limited to 533 MHz as stated in *Switching Characteristics Over Recommended Operating Conditions for DDR3 Memory Controller*.
(3) For valid DDR3 device configurations and device counts, see Section 8.13.4.2.4, Figure 8-54, and Figure 8-55.

8.13.4.2.4.2 PCB Stackup

The minimum stackup for routing the DDR3 interface is a four-layer stack up as shown in Table 8-67. Additional layers may be added to the PCB stackup to accommodate other circuitry, enhance SI/EMI performance, or to reduce the size of the PCB footprint. A six-layer stackup is shown in Table 8-68. Complete stackup specifications are provided in Table 8-69.

Table 8-67. Minimum PCB Stackup

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly vertical
2	Plane	Split power plane
3	Plane	Full ground plane
4	Signal	Bottom routing mostly horizontal

Table 8-68. Six-Layer PCB Stackup Suggestion

LAYER	TYPE	DESCRIPTION
1	Signal	Top routing mostly vertical
2	Plane	Ground
3	Plane	Split power plane
4	Plane	Split power plane or Internal routing
5	Plane	Ground
6	Signal	Bottom routing mostly horizontal

Table 8-69. PCB Stackup Specifications

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	PCB routing/plane layers	4	6		
2	Signal routing layers	2			
3	Full ground reference layers under DDR3 routing region (1)	1			
4	Full 1.5-V power reference layers under the DDR3 routing region (1)	1			
5	Number of reference plane cuts allowed within DDR routing region (2)			0	
6	Number of layers between DDR3 routing layer and reference plane (3)			0	
7	PCB routing feature size		4		Mils
8	PCB trace width, w		4		Mils
13	Single-ended impedance, Zo	50		75	Ω
14	Impedance control (4)	Z-5	Z	Z+5	Ω

(1) Ground reference layers are preferred over power reference layers. Be sure to include bypass caps to accommodate reference layer return current as the trace routes switch routing layers.
(2) No traces should cross reference plane cuts within the DDR routing region. High-speed signal traces crossing reference plane cuts create large return current paths which can lead to excessive crosstalk and EMI radiation.
(3) Reference planes are to be directly adjacent to the signal plane to minimize the size of the return current loop.
(4) Z is the nominal singled-ended impedance selected for the PCB specified by item 13.

8.13.4.2.4.3 Placement

Figure 8-56 shows the required placement for the processor as well as the DDR3 devices. The dimensions for this figure are defined in Table 8-70. The placement does not restrict the side of the PCB on which the devices are mounted. The ultimate purpose of the placement is to limit the maximum trace lengths and allow for proper routing space. For a 16-bit DDR memory system, the high-word DDR3 device(s) are omitted from the placement.

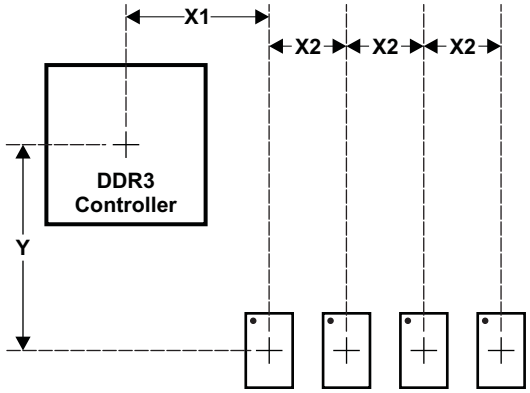

Figure 8-56. Placement Specifications

It is strongly recommended that high-speed bypass capacitors be placed and accommodated for during the placement and route planning phase. It is very difficult to add bypass capacitors once the board has been routed and significant rework may be required to meet the high-speed bypass capacitor requirements in Section 8.13.4.2.4.6, *High-Speed Bypass Capacitors* if the proper planning is not done. A particular challenge to placing bypass capacitors in congested areas is fitting the required vias. It is suggested that each pair of vias support two bypass capacitors by mounting one capacitor on the top of the board and other on the bottom. Do not share vias between capacitors mounted on the same side of the PCB. Another suggestion is to line up the vias for the bypass capacitors for the processor in rows forming channels to allow the signals to escape.

Table 8-70. Placement Specifications

NO.	PARAMETER	MIN	MAX	UNIT
1	X1 (1)(2)(3)		1000	Mils
2	X2 (1)(2)		600	Mils
3	Y Offset (1)(2)(3)		1500	Mils
4	DDR3 keepout region			
5	Clearance from non-DDR3 signal to DDR3 keepout region (4)(5)(6)	4		w

(1) For dimension definitions, see Figure 8-56.
(2) Measurements from center of processor to center of DDR3 device.
(3) Minimizing X1 and Y improves timing margins.
(4) w is defined as the signal trace width.
(5) Non-DDR3 signals allowed within DDR3 keepout region provided they are separated from DDR3 routing layers by a ground plane.
(6) If a device has more than one DDR controller, the signals from the other controller(s) are considered non-DDR3 and should be separated by this specification.

8.13.4.2.4.4 DDR3 Keepout Region

The region of the PCB used for DDR3 circuitry must be isolated from other signals. The DDR3 keepout region is defined for this purpose and is shown in Figure 8-57. The size of this region varies with the placement and DDR routing. Additional clearances required for the keepout region are shown in Table 8-70. Non-DDR3 signals should not be routed on the DDR signal layers within the DDR3 keepout region. Non-DDR3 signals may be routed in the region, provided they are routed on layers separated from the DDR signal layers by a ground layer. No breaks should be allowed in the reference ground layers in this region. In addition, the 1.5-V DDR3 power plane should cover the entire keepout region. Also note that if there is more than one DDR controller, the signals from each controller need to be separated from each other by the specification in Table 8-70, item 5. Each DDR controller should have its own DDR keepout region.

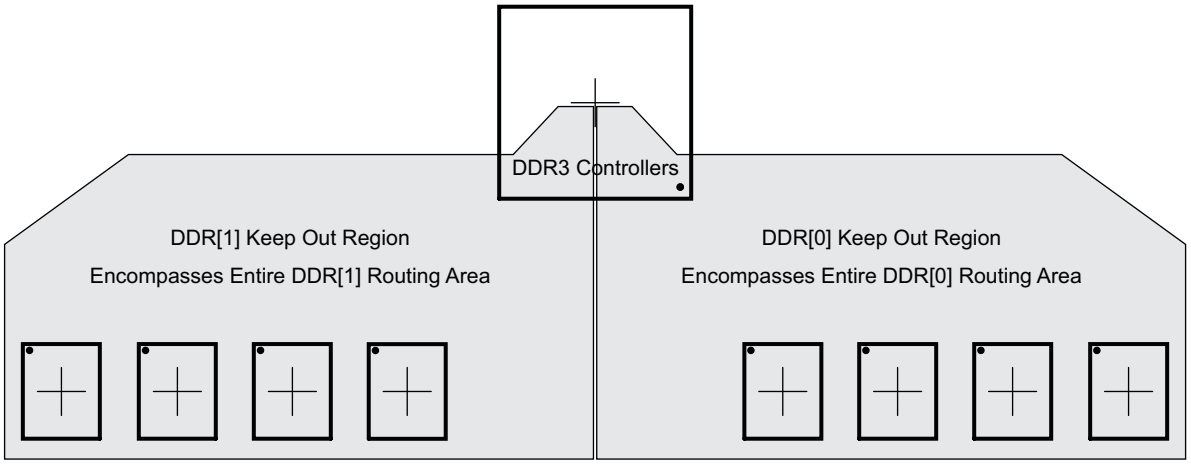

Figure 8-57. DDR3 Keepout Region

Figure 8-57 is an example of a processor with two DDR controllers. Processors with a single DDR controler will have only one DDR keepout region. Each DDR controller should have its own keepout region.

8.13.4.2.4.5 Bulk Bypass Capacitors

Bulk bypass capacitors are required for moderate speed bypassing of the DDR3 and other circuitry. Table 8-71 contains the minimum numbers and capacitance required for the bulk bypass capacitors. Note that this table only covers the bypass needs of the DDR3 controllers and DDR3 device(s). Additional bulk bypass capacitance may be needed for other circuitry.

Table 8-71. Bulk Bypass Capacitors Per DDR3 EMIF

NO.	PARAMETER	MIN	MAX	UNIT
1	DDR_1V5 bulk bypass capacitor count(1)	3		Devices
2	DDR_1V5 bulk bypass total capacitance	70		µF

(1) These devices should be placed near the devices they are bypassing, but preference should be given to the placement of the high-speed (HS) bypass capacitors and DDR3 signal routing.

8.13.4.2.4.6 High-Speed Bypass Capacitors

High-speed (HS) bypass capacitors are critical for proper DDR3 interface operation. It is particularly important to minimize the parasitic series inductance of the HS bypass capacitors, processor/DDR power, and processor/DDR ground connections. Table 8-72 contains the specification for the HS bypass capacitors as well as for the power connections on the PCB. Generally speaking, it is good to:

1. Fit as many HS bypass capacitors as possible.
2. Minimize the distance from the bypass cap to the pins/balls being bypassed.
3. Use the smallest physical sized capacitors possible with the highest capacitance readily available.
4. Connect the bypass capacitor pads to their vias using the widest traces possible and using the largest hole size via possible.
5. Minimize via sharing. Note the limits on via sharing shown in Table 8-72.

Table 8-72. High-Speed Bypass Capacitors

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	HS bypass capacitor package size(1)		201	402	10 Mils
2	Distance, HS bypass capacitor to processor being bypassed(2)(3)(4)			400	Mils
3	Processor DDR_1V5 HS bypass capacitor count(5)	35			Per DDR3 EMIF
4	Processor DDR_1V5 HS bypass capacitor total capacitance	5			µF
5	Number of connection vias for each device power/ground ball(6)				Vias
6	Trace length from device power/ground ball to connection via(2)		35	70	Mils
7	Distance, HS bypass capacitor to DDR device being bypassed(7)			150	Mils
8	DDR3 device HS bypass capacitor count(8)	12			Devices
9	DDR3 device HS bypass capacitor total capacitance(8)	0.85			µF
10	Number of connection vias for each HS capacitor(9)(10)	2			Vias
11	Trace length from bypass capacitor connect to connection via(2)(10)		35	100	Mils
12	Number of connection vias for each DDR3 device power/ground ball(11)	1			Vias
13	Trace length from DDR3 device power/ground ball to connection via(2)(9)		35	60	Mils

(1) LxW, 10-mil units, i.e., a 0402 is a 40x20-mil surface-mount capacitor.
(2) Closer/shorter is better.
(3) Measured from the nearest processor power/ground ball to the center of the capacitor package.
(4) Three of these capacitors should be located underneath the processor, between the cluster of DDR_1V5 balls and ground balls, between the DDR interfaces on the package.
(5) Per DDR3 EMIF. For example, a processor with two DDR3 EMIFs would require 70 capacitors. The capacitors should be evenly distributed near the Processor's DDR_1V5 pins.
(6) See the Via Channel™ escape for the processor package.
(7) Measured from the DDR3 device power/ground ball to the center of the capacitor package.
(8) Per DDR3 EMIF.
(9) An additional HS bypass capacitor can share the connection vias only if it is mounted on the opposite side of the board. No sharing of vias is permitted on the same side of the board.
(10) An HS bypass capacitor may share a via with a DDR device mounted on the same side of the PCB. A wide trace should be used for the connection and the length from the capacitor pad to the DDR device pad should be less than 150 mils.
(11) Up to a total of two pairs of DDR power/ground balls may share a via.

8.13.4.2.4.6.1 Return Current Bypass Capacitors and Vias

If a power plane is used as a reference plane then additional bypass capacitors may be required to accommodate the signal return currents. Care should be taken to minimize the layer transitions during routing. If a layer transition is necessary, it is better to transition to a layer using the same reference plane. If this cannot be accommodated, ensure there is a nearby path to allow the return currents to transition between reference planes. Transitions from power reference planes to ground reference planes must go through a bypass capacitor. Transition between different ground references or DVDD_DDR planes can go through a connecting via. As many of these return current bypass capacitors or vias should be used as possible. The goal is to minimize the size of the return current loops. Generally, this type of situation happens where signals must transition from horizontal to vertical routing and vice-versa.

8.13.4.2.4.7 Net Classes

Table 8-73 lists the clock net classes for the DDR3 interface. Table 8-74 lists the signal net classes, and associated clock net classes, for signals in the DDR3 interface. These net classes are used for the termination and routing rules that follow.

Table 8-73. Clock Net Class Definitions

CLOCK NET CLASS	PROCESSOR PIN NAMES
CK	DDR[x]_CLK/$\overline{\text{DDR[x]\_CLK}}$
DQS0	DDR[x]_DQS[0]/$\overline{\text{DDR[x]\_DQS[0]}}$
DQS1	DDR[x]_DQS[1]/$\overline{\text{DDR[x]\_DQS[1]}}$
DQS2(1)	DDR[x]_DQS[2]/$\overline{\text{DDR[x]\_DQS[2]}}$
DQS3(1)	DDR[x]_DQS[3]/$\overline{\text{DDR[x]\_DQS[3]}}$

(1) Only used on 32-bit wide DDR3 memory systems.

Table 8-74. Signal Net Class Definitions

CLOCK NET CLASS	ASSOCIATED CLOCK NET CLASS	PROCESSOR PIN NAMES
ADDR_CTRL	CK	$\overline{\text{DDR[x]\_BA}}$[2:0], DDR[x]_A[14:0], $\overline{\text{DDR[x]\_CS[x]}}$, $\overline{\text{DDR[x]\_CAS}}$, $\overline{\text{DDR[x]\_RAS}}$, $\overline{\text{DDR[x]\_WE}}$, DDR[x]_CKE, DDR[x]_ODT[x]
DQ0	DQS0	DDR[x]_D[7:0], DDR[x]_DQM[0]
DQ1	DQS1	DDR[x]_D[15:8], DDR[x]_DQM[1]
DQ2(1)	DQS2	DDR[x]_D[23:16], DDR[x]_DQM[2]
DQ3(1)	DQS3	DDR[x]_D[31:24], DDR[x]_DQM[3]

(1) Only used on 32-bit wide DDR3 memory systems.

8.13.4.2.4.8 DDR3 Signal Termination

Signal terminators are required for the CK and ADDR_CTRL net classes. The data lines are terminated by ODT and, thus, the PCB traces should be unterminated. Detailed termination specifications are covered in the routing rules in the following sections.

8.13.4.2.4.9 VREFSSTL_DDR Routing

VREFSSTL_DDR (VREF) is used as a reference by the input buffers of the DDR3 memories as well as the processor. VREF is intended to be half the DDR3 power supply voltage and is typically generated with the DDR3 1.5-V and VTT power supply. It should be routed as a nominal 20-mil wide trace with 0.1 µF bypass capacitors near each device connection. Narrowing of VREF is allowed to accommodate routing congestion.

8.13.4.2.4.10 VTT

Like VREF, the nominal value of the VTT supply is half the DDR3 supply voltage. Unlike VREF, VTT is expected to source and sink current, specifically the termination current for the ADDR_CTRL net class Thevinen terminators. VTT is needed at the end of the address bus and it should be routed as a power sub-plane. VTT should be bypassed near the terminator resistors.

8.13.4.2.4.11 CK and ADDR_CTRL Topologies and Routing Definition

The CK and ADDR_CTRL net classes are routed similarly and are length matched to minimize skew between them. CK is a bit more complicated because it runs at a higher transition rate and is differential. The following subsections show the topology and routing for various DDR3 configurations for CK and ADDR_CTRL. Only the components shown in the topologies are allowed. Items such as test points and additional terminations are specifically disallowed. The figures in the following subsections define the terms for the routing specification detailed in Table 8-75.

Care should be taken to minimize layer transitions during routing. If a layer transition is necessary, it is better to transition to a layer using the same reference plane. If this cannot be accommodated, ensure there are nearby ground vias to allow the return currents to transition between reference planes if both reference planes are ground or DVDD_DDR. Ensure there are nearby bypass capacitors to allow the return currents to transition between reference planes if one of the reference planes is ground. The goal is to minimize the size of the return current loops.

8.13.4.2.4.11.1 Four DDR3 Devices

Four DDR3 devices are supported on the DDR EMIF consisting of four x8 DDR3 devices arranged as one bank (CS). These four devices may be mounted on a single side of the PCB, or may be mirrored in two pairs to save board space at a cost of increased routing complexity and parts on the backside of the PCB.

8.13.4.2.4.11.2 CK and ADDR_CTRL Topologies, Four DDR3 Devices

Figure 8-58 shows the topology of the CK net classes and Figure 8-59 shows the topology for the corresponding ADDR_CTRL net classes.

8.13.4.2.4.12 Data Topologies and Routing Definition

No matter the number of DDR3 devices used, the data line topology is always point-to-point, so its definition is simple.

Care should be taken to minimize layer transitions during routing. If a layer transition is necessary, it is better to transition to a layer using the same reference plane. If this cannot be accommodated, ensure there are nearby ground vias to allow the return currents to transition between reference planes if both reference planes are ground or DVDD_DDR. Ensure there are nearby bypass capacitors to allow the return currents to transition between reference planes if one of the reference planes is ground. The goal is to minimize the size of the return current loops.

8.13.4.2.4.12.1 DQS and DQ/DM Topologies, Any Number of Allowed DDR3 Devices

DQS lines are point-to-point differential, and DQ/DM lines are point-to-point singled ended. Figure 8-74 and Figure 8-75 show these topologies.

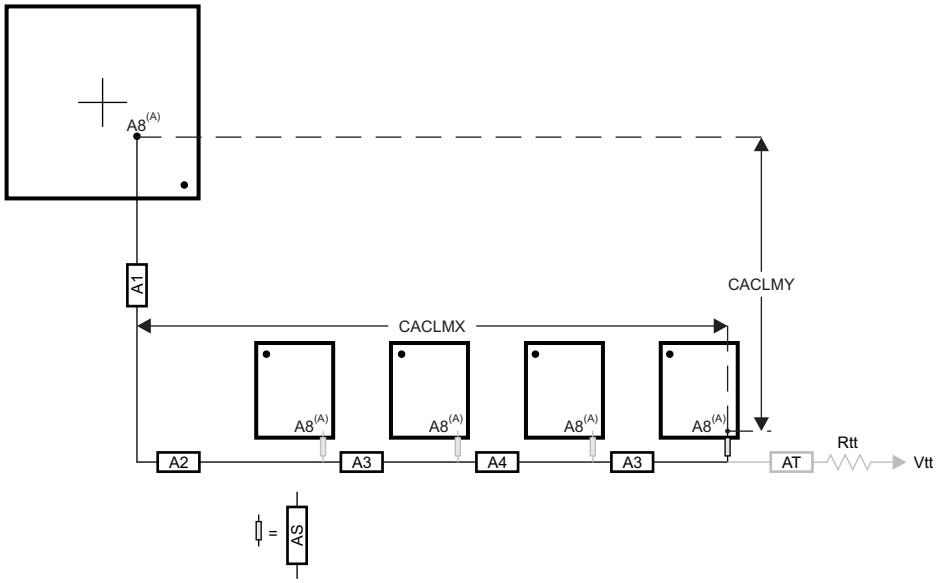
8.13.4.2.4.13 Routing Specification

8.13.4.2.4.13.1 CK and ADDR_CTRL Routing Specification

Skew within the CK and ADDR_CTRL net classes directly reduces setup and hold margin and, thus, this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. A metric to establish this maximum length is Manhattan distance. The Manhattan distance between two points on a PCB is the length between the points when connecting them only with horizontal or vertical segments. A reasonable trace route length is to within a percentage of its Manhattan distance. CACLM is defined as Clock Address Control Longest Manhattan distance.

Given the clock and address pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 8-78 and Figure 8-79 show this distance for four loads and two loads, respectively. It is from this distance that the specifications on the lengths of the transmission lines for the address bus are determined. CACLM is determined similarly for other address bus configurations; i.e., it is based on the longest net of the CK/ADDR_CTRL net class. For CK and ADDR_CTRL routing, these specifications are contained in Table 8-75.

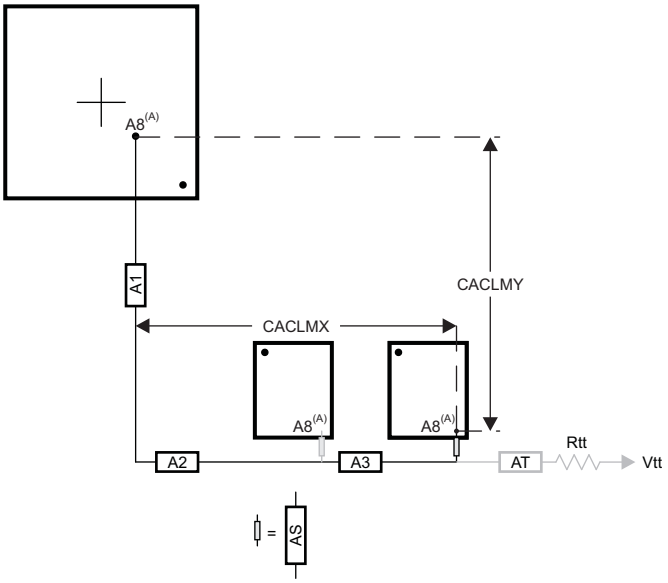


A. It is very likely that the longest CK/ADDR_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR_CTRL skew matching and length control.

The length of shorter CK/ADDR_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.
The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

Figure 8-78. CACLM for Four Address Loads on One Side of PCB



A. It is very likely that the longest CK/ADDR_CTRL Manhattan distance will be for Address Input 8 (A8) on the DDR3 memories. CACLM is based on the longest Manhattan distance due to the device placement. Verify the net class that satisfies this criteria and use as the baseline for CK/ADDR_CTRL skew matching and length control.

The length of shorter CK/ADDR_CTRL stubs as well as the length of the terminator stub are not included in this length calculation. Non-included lengths are grayed out in the figure.

Assuming A8 is the longest, CALM = CACLMY + CACLMX + 300 mils.
The extra 300 mils allows for routing down lower than the DDR3 memories and returning up to reach A8.

Figure 8-79. CACLM for Two Address Loads on One Side of PCB

Table 8-75. CK and ADDR_CTRL Routing Specification(1)(2)

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	A1+A2 length			2500	mils
2	A1+A2 skew			25	mils
3	A3 length			660	mils
4	A3 skew(3)			25	mils
5	A3 skew(4)			125	mils
6	A4 length			660	mils
7	A4 skew			25	mils
8	AS length			100	mils
9	AS skew			100	mils
10	AS+/AS- length			70	mils
11	AS+/AS- skew			5	mils
12	AT length(5)		500		mils
13	AT skew(6)		100		mils
14	AT skew(7)			5	mils
15	CK/ADDR_CTRL nominal trace length(8)	CACLM-50	CACLM	CACLM+50	mils
16	Center-to-center CK to other DDR3 trace spacing(9)	4w			
17	Center-to-center ADDR_CTRL to other DDR3 trace spacing(9)(10)	4w			
18	Center-to-center ADDR_CTRL to other ADDR_CTRL trace spacing(9)	3w			
19	CK center-to-center spacing(11)		(12)		
20	CK spacing to other net(9)	4w			
21	Rcp(13)	Zo-1	Zo	Zo+	Ω
22	Rtt(13)(14)	Zo-5	Zo	Zo+5	Ω

(1) The use of vias should be minimized.
(2) Additional bypass capacitors are required when using the DDR_1V5 plane as the reference plane to allow the return current to jump between the DDR_1V5 plane and the ground plane when the net class switches layers at a via.
(3) Non-mirrored configuration (all DDR3 memories on same side of PCB).
(4) Mirrored configuration (one DDR3 device on top of the board and one DDR3 device on the bottom).
(5) While this length can be increased for convenience, its length should be minimized.
(6) ADDR_CTRL net class only (not CK net class). Minimizing this skew is recommended, but not required.
(7) CK net class only.
(8) CACLM is the longest Manhattan distance of the CK and ADDR_CTRL net classes + 300 mils. For definition, see Section 8.13.4.2.4.13.1, Figure 8-78, and Figure 8-79.
(9) Center-to-center spacing is allowed to fall to minimum (w) for up to 1250 mils of routed length.
(10) The ADDR_CTRL net class of the other DDR EMIF is considered *other DDR3 trace spacing*.
(11) CK spacing set to ensure proper differential impedance.
(12) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the single-ended impedance, Zo.
(13) Source termination (series resistor at driver) is specifically not allowed.
(14) Termination values should be uniform across the net class.

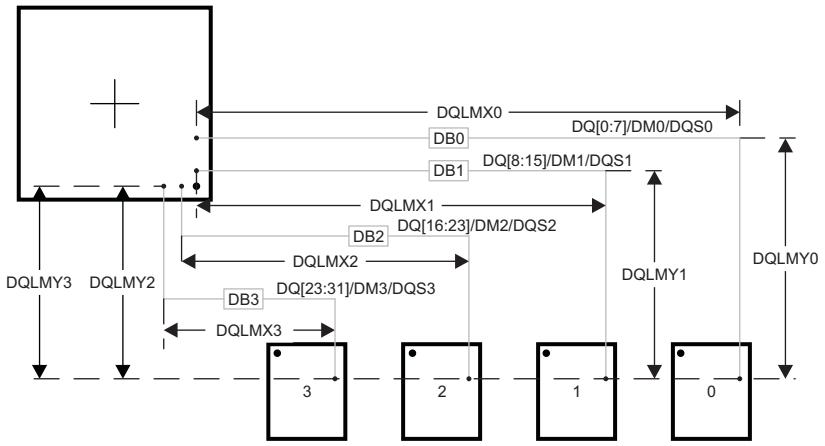
8.13.4.2.4.13.2 DQS and DQ Routing Specification

Skew within the DQS and DQ/DM net classes directly reduces setup and hold margin and thus this skew must be controlled. The only way to practically match lengths on a PCB is to lengthen the shorter traces up to the length of the longest net in the net class and its associated clock. As with CK and ADDR_CTRL, a reasonable trace route length is to within a percentage of its Manhattan distance. DQLMn is defined as DQ Longest Manhattan distance n, where n is the byte number. For a 32-bit interface, there are four DQLMs, DQLM0–DQLM3. Likewise, for a 16-bit interface, there are two DQLMs, DQLM0–DQLM1.

NOTE

It is not required, nor is it recommended, to match the lengths across all bytes. Length matching is only required within each byte.

Given the DQS and DQ/DM pin locations on the processor and the DDR3 memories, the maximum possible Manhattan distance can be determined given the placement. Figure 8-80 shows this distance for four loads. It is from this distance that the specifications on the lengths of the transmission lines for the data bus are determined. For DQS and DQ/DM routing, these specifications are contained in Table 8-76.



DB0 - DB3 represent data bytes 0 - 3.

There are four DQLMs, one for each byte (32-bit interface). Each DQLM is the longest Manhattan distance of the byte; therefore:
DQLM0 = DQLMX0 + DQLMY0
DQLM1 = DQLMX1 + DQLMY1
DQLM2 = DQLMX2 + DQLMY2
DQLM3 = DQLMX3 + DQLMY3

Figure 8-80. DQLM for Any Number of Allowed DDR3 Devices

Table 8-76. Data Routing Specification(1)

NO.	PARAMETER	MIN	TYP	MAX	UNIT
1	DB0 nominal length(2)(3)			DQLM0	mils
2	DB1 nominal length(2)(4)			DQLM1	mils
3	DB2 nominal length(2)(5)			DQLM2	mils
4	DB3 nominal length(2)(6)			DQLM3	mils
5	DBn skew(7)			25	mils
6	DQSn+ to DQSn- skew			5	mils
7	DQSn to DBn skew(7)(8)			25	mils
8	Center-to-center DBn to other DDR3 trace spacing(9)(10)	4w			
9	Center-to-center DBn to other DBn trace spacing(9)(11)	3w			
10	DQSn center-to-center spacing(12)		(13)		
11	DQSn center-to-center spacing to other net(9)	4w			

(1) External termination disallowed. Data termination should use built-in ODT functionality.
(2) DQLMn is the longest Manhattan distance of a byte. For definition, see Section 8.13.4.2.4.13.2 and Figure 8-80.
(3) DQLM0 is the longest Manhattan length for the net classes of Byte 0.
(4) DQLM1 is the longest Manhattan length for the net classes of Byte 1.
(5) DQLM2 is the longest Manhattan length for the net classes of Byte 2.
(6) DQLM3 is the longest Manhattan length for the net classes of Byte 3.
(7) Length matching is only done within a byte. Length matching across bytes is neither required nor recommended.
(8) Each DQS pair is length matched to its associated byte.
(9) Center-to-center spacing is allowed to fall to minimum (w) for up to 1250 mils of routed length.
(10) Other DDR3 trace spacing means other DDR3 net classes not within the byte.
(11) This applies to spacing within the net classes of a byte.
(12) DQS pair spacing is set to ensure proper differential impedance.
(13) The most important thing to do is control the impedance so inadvertent impedance mismatches are not created. Generally speaking, center-to-center spacing should be either 2w or slightly larger than 2w to achieve a differential impedance equal to twice the single-ended impedance, Zo.

8.14 Multichannel Audio Serial Port (McASP)

The multichannel audio serial port (McASP) functions as a general-purpose audio serial port optimized for the needs of multichannel audio applications. The McASP is useful for time-division multiplexed (TDM) stream, Inter-Integrated Sound (I2S) protocols, and inter-component digital audio interface transmission (DIT).

8.14.1 McASP Device-Specific Information

The device includes six multichannel audio serial port (McASP) interface peripherals (McASP0, McASP1, McASP2, McASP3, McASP4, and McASP5). The McASP module consists of a transmit and receive section. On McASP0/1, these sections can operate completely independently with different data formats, separate master clocks, bit clocks, and frame syncs or, alternatively, the transmit and receive sections may be synchronized. On McASP2, McASP3, McASP4, and McASP5, the transmit and receive sections must always be synchronized. The McASP module also includes shift registers that may be configured to operate as either transmit data or receive data.

The transmit section of the McASP can transmit data in either a time-division-multiplexed (TDM) synchronous serial format or in a digital audio interface (DIT) format where the bit stream is encoded for S/PDIF, AES-3, IEC-60958, CP-430 transmission. The receive section of the McASP peripheral supports the TDM synchronous serial format.

The McASP module can support one transmit data format (either a TDM format or DIT format) and one receive format at a time. All transmit shift registers use the same format and all receive shift registers use the same format; however, the transmit and receive formats need not be the same. Both the transmit and receive sections of the McASP also support burst mode, which is useful for non-audio data (for example, passing control information between two devices).

The McASP peripheral has additional capability for flexible clock generation and error detection/handling, as well as error management.

The device McASP0 and McASP1 modules have up to 10 serial data pins, while McASP2, McASP3, McASP4, and McASP5 are limited to up to four serial data pins each. The McASP FIFO size is 256 bytes and two DMA and two interrupt requests are supported. Buffers are used transparently to better manage DMA, which can be leveraged to manage data flow more efficiently.

For more detailed information on and the functionality of the McASP peripheral, see the *Multichannel Audio Serial Port (McASP)* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

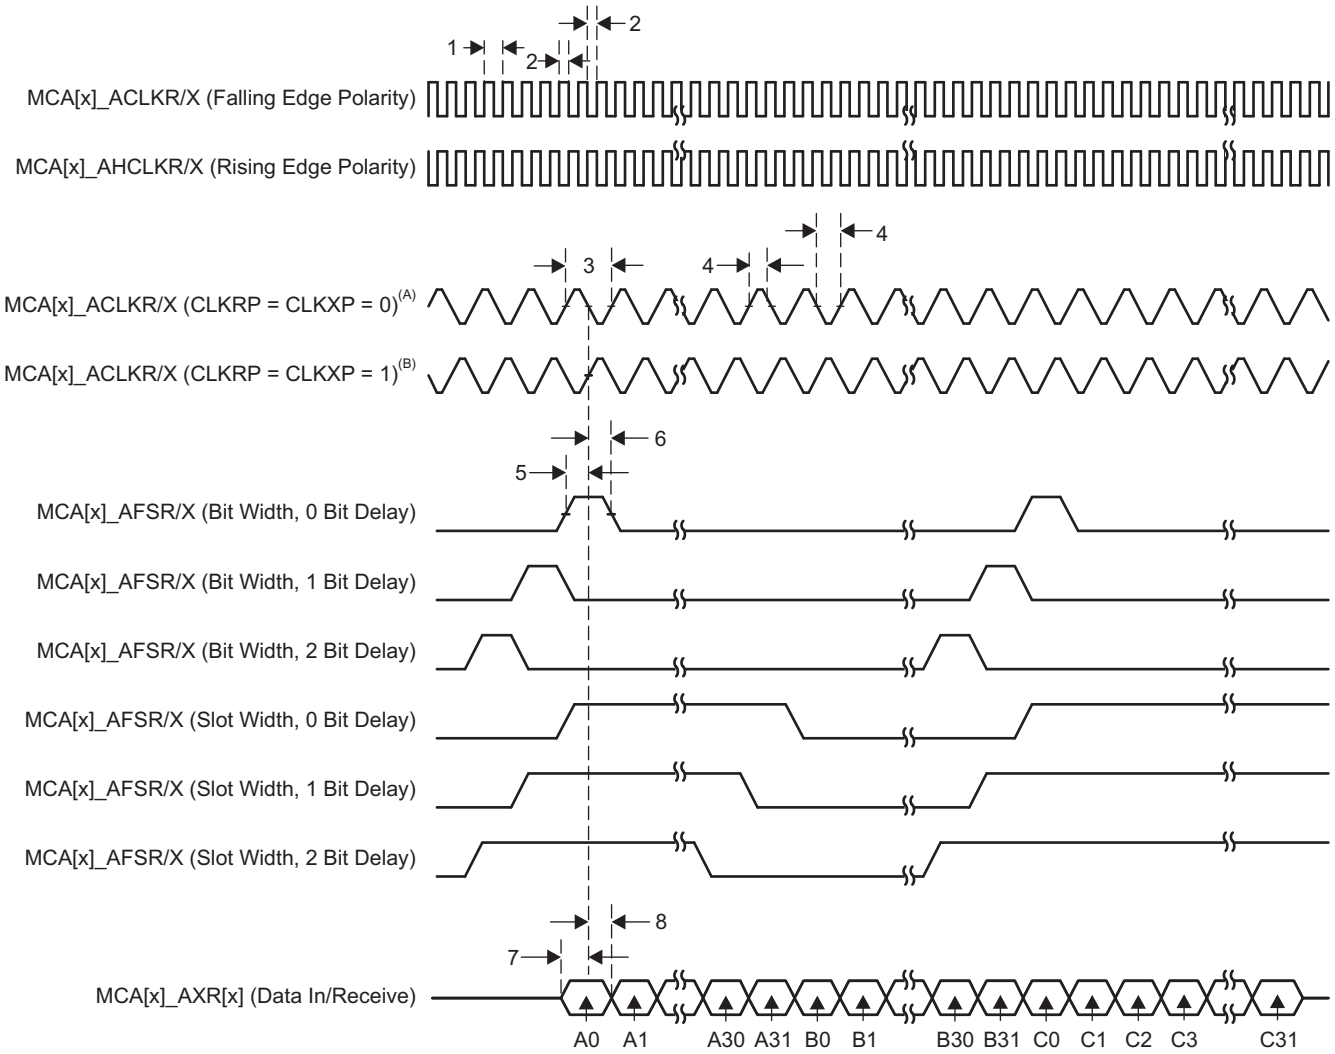
8.14.3 McASP (McASP[5:0]) Electrical Data/Timing

Table 8-78. Timing Requirements for McASP(1)

(see Figure 8-81)

NO.				OPP100/120/166				UNIT
				McASP[5:2,0] Only		McASP1 Only		
				MIN	MAX	MIN	MAX	
1	$t_{c(AHCLKRX)}$	Cycle time, MCA[x]_AHCLKR/X		20		20		ns
2	$t_{w(AHCLKRX)}$	Pulse duration, MCA[x]_AHCLKR/X high or low		0.5P - 3(2)		0.5P - 3(2)		ns
3	$t_{c(ACLKRX)}$	Cycle time, MCA[x]_ACLKR/X	Any Other Conditions	20		20		ns
			ACLKx, AFSX and AXR are all inputs	–		12.5		ns
4	$t_{w(ACLKRX)}$	Pulse duration, MCA[x]_ACLKR/X high or low	Any Other Conditions	0.5R - 3(3)		0.5R - 3(3)		ns
			ACLKx, AFSX and AXR are all inputs	–		0.5R - 1.5(3)		ns
5	$t_{su(AFSRX-ACLKRX)}$	Setup time, MCA[x]_AFSR/X input valid before MCA[X]_ACLKR/X	ACLKR/X int	10.5		10.5		ns
			ACLKR/X ext in	4		2		
			ACLKR/X ext out	4		2		
6	$t_{h(ACLKRX-AFSRX)}$	Hold time, MCA[x]_AFSR/X input valid after MCA[X]_ACLKR/X	ACLKR/X int	-1		-1		ns
			ACLKR/X ext in	1		2		
			ACLKR/X ext out	1		2		
7	$t_{su(AXR-ACLKRX)}$	Setup time, MCA[x]_AXR input valid before MCA[X]_ACLKR/X	ACLKR/X int	10.5		10.5		ns
			ACLKR/X ext in	4		2		
			ACLKR/X ext out	4		2		
8	$t_{h(ACLKRX-AXR)}$	Hold time, MCA[x]_AXR input valid after MCA[X]_ACLKR/X	ACLKR/X int	-1		-1		ns
			ACLKR/X ext in	1		2		
			ACLKR/X ext out	1		2		

(1) ACLKR internal: ACLKRCTL.CLKRM=1, PDIR.ACLKR = 1
ACLKR external input: ACLKRCTL.CLKRM=0, PDIR.ACLKR=0
ACLKR external output: ACLKRCTL.CLKRM=0, PDIR.ACLKR=1
ACLKX internal: ACLKXCTL.CLKXM=1, PDIR.ACLKX = 1
ACLKX external input: ACLKXCTL.CLKXM=0, PDIR.ACLKX=0
ACLKX external output: ACLKXCTL.CLKXM=0, PDIR.ACLKX=1
(2) P = MCA[x]_AHCLKR/X period in nano seconds (ns).
(3) R = MCA[x]_ACLKR/X period in ns.



A. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

B. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

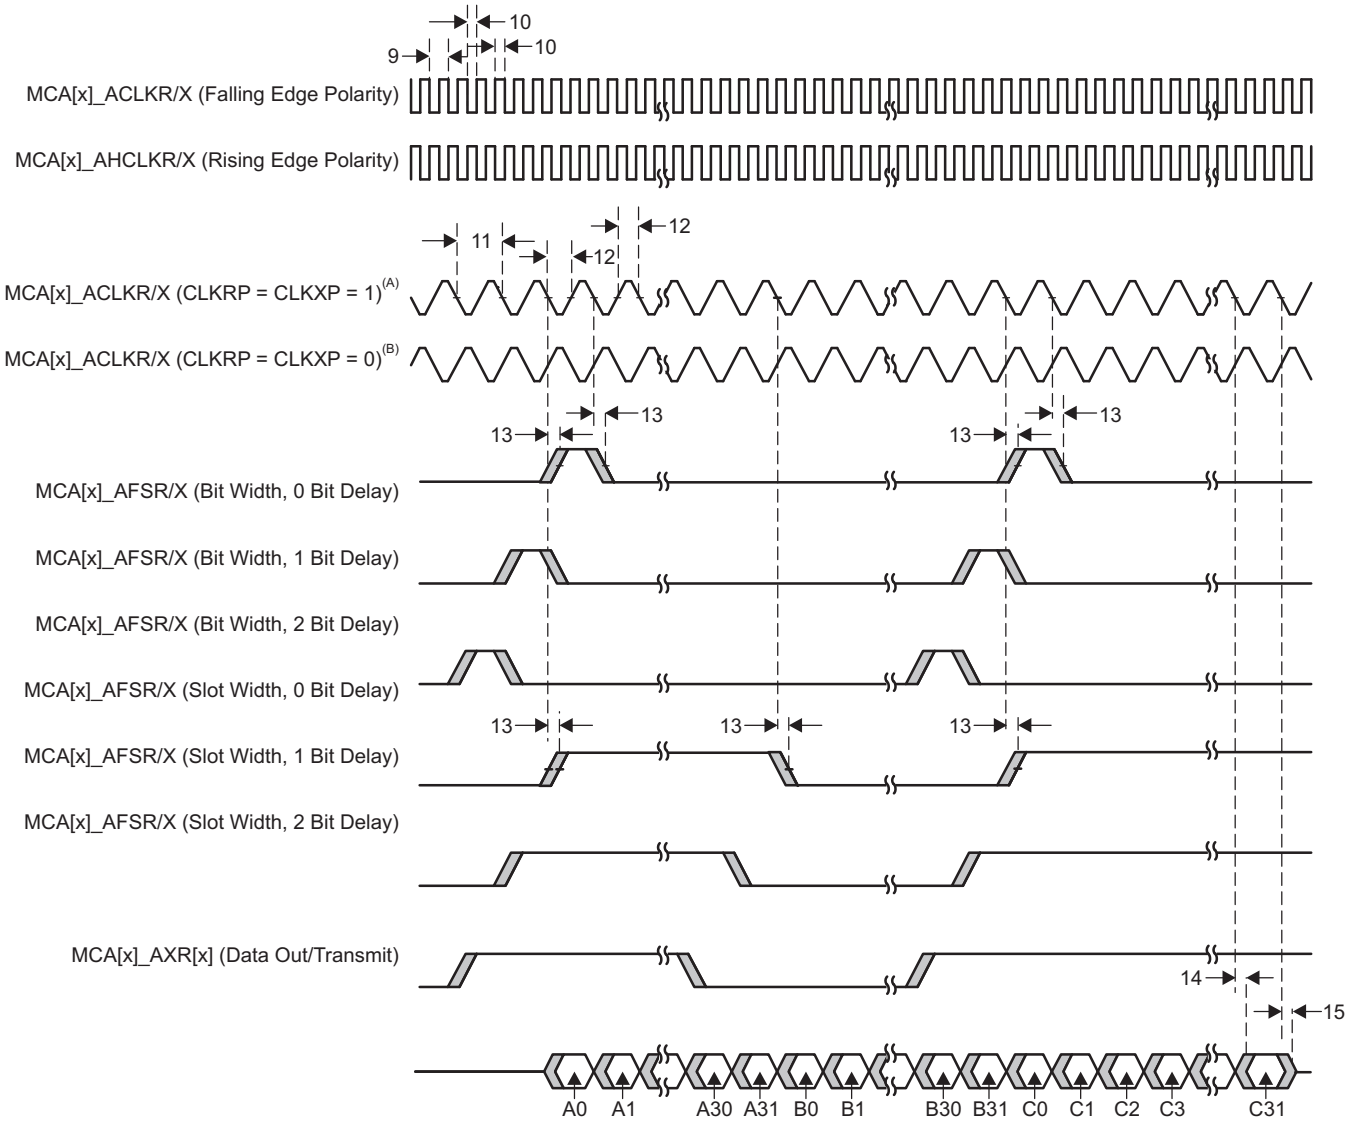
Figure 8-81. McASP Input Timing

Table 8-79. Switching Characteristics Over Recommended Operating Conditions for McASP[1]

(see Figure 8-82)

NO.	PARAMETER			OPP100/120/166		UNIT
				MIN	MAX	
9	$t_{c(AHCLKRX)}$	Cycle time, MCA[X]_AHCLKR/X		20[2]		ns
10	$t_{w(AHCLKRX)}$	Pulse duration, MCA[X]_AHCLKR/X high or low		0.5P - 2.5[3]		ns
11	$t_{c(ACLKRX)}$	Cycle time, MCA[X]_ACLKR/X		20		ns
12	$t_{w(ACLKRX)}$	Pulse duration, MCA[X]_ACLKR/X high or low		0.5P - 2.5[3]		ns
13	$t_{d(ACLKRX-AFSRX)}$	Delay time, MCA[X]_ACLKR/X transmit edge to MCA[X]_AFSR/X output valid	ACLKR/X int	-2	5	ns
			ACLKR/X ext in	1	11.5	
		Delay time, MCA[X]_ACLKR/X transmit edge to MCA[X]_AFSR/X output valid with Pad Loopback	ACLKR/X ext out	1	11.5	
14	$t_{d(ACLKX-AXR)}$	Delay time, MCA[X]_ACLKX transmit edge to MCA[X]_AXR output valid	ACLKX int	-2	5	ns
			ACLKX ext in	1	11.5	
		Delay time, MCA[X]_ACLKX transmit edge to MCA[X]_AXR output valid with Pad Loopback	ACLKX ext out	1	11.5	
15	$t_{dis(ACLKX-AXR)}$	Disable time, MCA[X]_ACLKX transmit edge to MCA[X]_AXR output high impedance	ACLKX int	-2	5	ns
			ACLKX ext in	1	11.5	
		Disable time, MCA[X]_ACLKX transmit edge to MCA[X]_AXR output high impedance with Pad Loopback	ACLKX ext out	1	11.5	

(1) ACLKR internal: ACLKRCTL.CLKRM=1, PDIR.ACLKR = 1
ACLKR external input: ACLKRCTL.CLKRM=0, PDIR.ACLKR=0
ACLKR external output: ACLKRCTL.CLKRM=0, PDIR.ACLKR=1
ACLKX internal: ACLKXCTL.CLKXM=1, PDIR.ACLKX = 1
ACLKX external input: ACLKXCTL.CLKXM=0, PDIR.ACLKX=0
ACLKX external output: ACLKXCTL.CLKXM=0, PDIR.ACLKX=1
(2) 50 MHz
(3) P = AHCLKR/X period.



A. For CLKRP = CLKXP = 1, the McASP transmitter is configured for falling edge (to shift data out) and the McASP receiver is configured for rising edge (to shift data in).

B. For CLKRP = CLKXP = 0, the McASP transmitter is configured for rising edge (to shift data out) and the McASP receiver is configured for falling edge (to shift data in).

Figure 8-82. McASP Output Timing

8.15 Multichannel Buffered Serial Port (McBSP)

The McBSP provides these functions:

- Full-duplex communication
- Double-buffered data registers, which allow a continuous data stream
- Independent framing and clocking for receive and transmit
- Direct interface to industry-standard codecs, analog interface chips (AICs), and other serially connected analog-to-digital (A/D) and digital-to-analog (D/A) devices
- Supports TDM, I2S, and similar formats
- External shift clock or an internal, programmable frequency shift clock for data transfer
- 5KB Tx and Rx buffer
- Supports three interrupt and two DMA requests.

The McBSP module may support two types of data transfer at the system level:

- The full-cycle mode, for which one clock period is used to transfer the data, generated on one edge and captured on the same edge (one clock period later).
- The half-cycle mode, for which one half clock period is used to transfer the data, generated on one edge and captured on the opposite edge (one half clock period later). Note that a new data is generated only every clock period, which secures the required hold time. The interface clock (CLKX/CLKR) activation edge (data/frame sync capture and generation) has to be configured accordingly with the external peripheral (activation edge capability) and the type of data transfer required at the system level.

For more detailed information on the McBSP peripheral, see the *Multichannel Buffered Serial Port (McBSP)* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

The following sections describe the timing characteristics for applications in normal mode (that is, the McBSP connected to one peripheral) and TDM applications in multipoint mode.

8.15.1 McBSP Peripheral Register Descriptions

Table 8-80. McBSP Registers(1)

8.15.2 McBSP Electrical Data/Timing

Table 8-81. Timing Requirements for McBSP - Master Mode(1)

(see Figure 8-83)

NO.			OPP100/120/166		UNIT
			MIN	MAX	
6	$t_{su(DRV-CLKAE)}$	Setup time, MCB_DR valid before MCB_CLK active edge(2)	3.5		ns
7	$t_{h(CLKAE-DRV)}$	Hold time, MCB_DR valid after MCB_CLK active edge(2)	3.5		ns

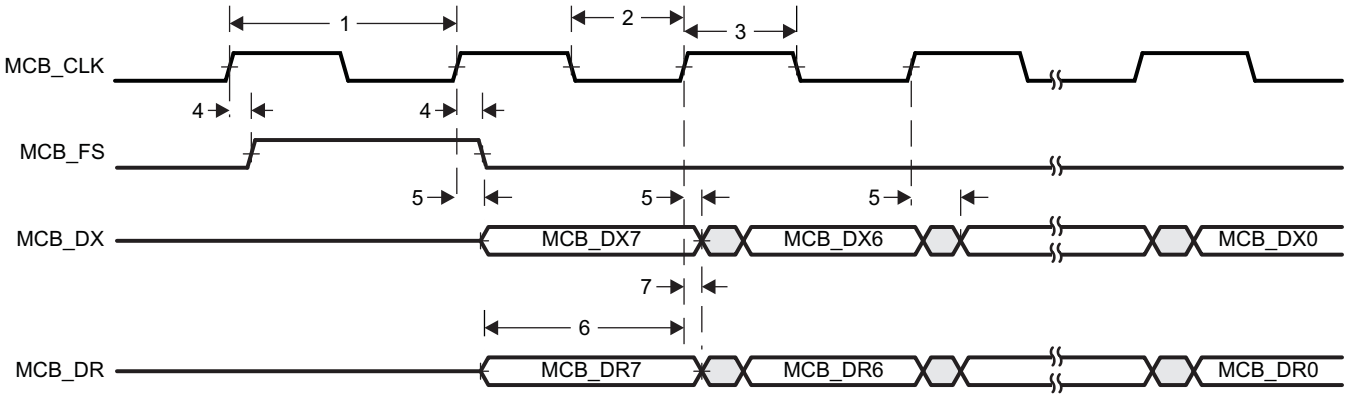
(1) The timings apply to all configurations regardless of MCB_CLK polarity and which clock edges are used to drive output data and capture input data.
(2) MCB_CLK corresponds to either MCB_CLKX or MCB_CLKR.

Table 8-82. Switching Characteristics Over Recommended Operating Conditions for McBSP - Master Mode(1)

(see Figure 8-83)

NO.	PARAMETER		OPP100/120/166		UNIT
			MIN	MAX	
1	$t_{c(CLK)}$	Cycle time, output MCB_CLK period(2)	20.83		ns
2	$t_{w(CLKL)}$	Pulse duration, output MCB_CLK low(2)	0.5*P - 1(3)		ns
3	$t_{w(CLKH)}$	Pulse duration, output MCB_CLK high(2)	0.5*P - 1(3)		ns
4	$t_{d(CLKAE-FSV)}$	Delay time, output MCB_CLK active edge to output MCB_FS valid(2)(4)	0.3	9.4	ns
5	$t_{d(CLKXAE-DXV)}$	Delay time, output MCB_CLKX active edge to output MCB_DX valid	0.3	9.4	ns

(1) The timings apply to all configurations regardless of MCB_CLK polarity and which clock edges are used to drive output data and capture input data.
(2) MCB_CLK corresponds to either MCB_CLKX or MCB_CLKR.
(3) P = MCB_CLKX/MCB_CLKR output CLK period, in ns; use whichever value is greater. This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKX/R) in the reasonable range of 40/60 duty cycle.
(4) MCB_FS corresponds to either MCB_FSX or MCB_FSR.



A. The timings apply to all configurations regardless of MCB_CLK polarity and which clock edges are used to drive output data and capture input data.

B. MCBSP_CLK corresponds to either MCBSP_CLKX or MCBSP_CLKR; MCBSP_FS corresponds to either MCBSP_FSX or MCBSP_FSR. McBSP in 6-pin mode: DX and DR as data pins; CLKX, CLKR, FSX and FSR as control pins. McBSP in 4-pin mode: DX and DR as data pins; CLKX and FSX pins as control pins. The CLKX and FSX pins are internally looped back via software configuration, respectively to the CLKR and FSR internal signals for data receive.

C. The polarity of McBSP frame synchronization is software configurable.

D. The active clock edge selection of MCBSP_CLK (rising or falling) on which MCBSP_DX data is latched and MCBSP_DR data is sampled is software configurable.

E. Timing diagrams are for data delay set to 1.

F. For further details about the registers used to configure McBSP, see the *Multichannel Buffered Serial Port (McBSP)* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

Figure 8-83. McBSP Master Mode Timing

Table 8-83. Timing Requirements for McBSP - Slave Mode(1)

(see Figure 8-84)

NO.			OPP100/120/166		UNIT
			MIN	MAX	
1	$t_{c(CLK)}$	Cycle time, MCB_CLK period(2)	20.83		ns
2	$t_{w(CLKL)}$	Pulse duration, MCB_CLK low(2)	0.5*P - 1(3)		ns
3	$t_{w(CLKH)}$	Pulse duration, MCB_CLK high(2)	0.5*P - 1(3)		ns
4	$t_{su(FSV-CLKAE)}$	Setup time, MCB_FS valid before MCB_CLK active edge(2)(4)	3.8		ns
5	$t_{h(CLKAE-FSV)}$	Hold time, MCB_FS valid after MCB_CLK active edge(2)(4)	0.5		ns
7	$t_{su(DRV-CLKAE)}$	Setup time, MCB_DR valid before MCB_CLK active edge(2)	3.8		ns
8	$t_{h(CLKAE-DRV)}$	Hold time, MCB_DR valid after MCB_CLK active edge(2)	0.5		ns

(1) The timings apply to all configurations regardless of MCB_CLK polarity and which clock edges are used to drive output data and capture input data.
(2) MCB_CLK corresponds to either MCB_CLKX or MCB_CLKR.
(3) P = MCB_CLKX/MCB_CLKR output CLK period, in ns; use whichever value is greater. This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKX/R) in the reasonable range of 40/60 duty cycle.
(4) MCB_FS corresponds to either MCB_FSX or MCB_FSR.

8.16 MultiMedia Card/Secure Digital/Secure Digital Input Output (MMC/SD/SDIO)

The device includes 3 MMC/SD/SDIO Controllers which are compliant with MMC V4.3, Secure Digital Part 1 Physical Layer Specification V2.00 and Secure Digital Input Output (SDIO) V2.00 specifications.

The device MMC/SD/SDIO Controller has the following features:

- MultiMedia card (MMC)
- Secure Digital (SD) memory card
- MMC/SD protocol support
- SDIO protocol support
- Programmable clock frequency
- 1024 byte read/write FIFO to lower system overhead
- Slave EDMA transfer capability
- SD High capacity support

8.17 Peripheral Component Interconnect Express (PCIe)

The device supports connections to PCIe-compliant devices via the integrated PCIe master/slave bus interface. The PCIe module is comprised of a dual-mode PCIe core and a SerDes PHY. The device implements a single one-lane PCIe 2.0 (5.0 GT/s) Endpoint/Root Complex port.

The device PCIe supports the following features:

- Supports Gen1/Gen2 in x1 or x2 mode
- One port with one 5 GT/s lane
- Single virtual channel (VC), single traffic class (TC)
- Single function in end-point mode
- Automatic width and speed negotiation and lane reversal
- Max payload: 128 byte outbound, 256 byte inbound
- Automatic credit management
- ECRC generation and checking
- Configurable BAR filtering
- Supports PCIe messages
- Legacy interrupt reception (RC) and generation (EP)
- MSI generation and reception
- PCI device power management, except D3 cold with vaux
- Active state power management state L0 and L1.

For more detailed information on the PCIe port peripheral module, see the *PCI Express (PCIe) Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

The PCIe peripheral on the device conforms to the PCI Express Base 2.0 Specification.

8.17.2 PCIe Electrical Data/Timing

Texas Instruments (TI) has performed the simulation and system characterization to ensure that the PCIe peripheral meets all AC timing specifications as required by the PCI Express Base 2.0 Specification. Therefore, the AC timing specifications are not reproduced here. For more information on the AC timing specifications, see Sections 4.3.3.5 and 4.3.4.4 of the PCI Express Base 2.0 Specification.

8.17.3 PCIe Design and Layout Guidelines

8.17.3.1 Clock Source

A standard 100-MHz PCIe differential clock source must be used for PCIe operation (for more details, see Section 7.4.2, *SERDES CLKN/P Input Clock*).

8.17.3.2 PCIe Connections and Interface Compliance

The PCIe interface on the device is compliant with the PCI Express Base 2.0 Specification. Refer to the PCIe specifications for all connections that are described in it. For coupling capacitor selection, see Section 8.17.3.2.1, *Coupling Capacitors*.

The use of PCIe-compatible bridges and switches is allowed for interfacing with more than one other processor or PCIe device.

8.17.3.2.1 Coupling Capacitors

AC coupling capacitors are required on the transmit data pair. Table 8-96 shows the requirements for these capacitors.

Table 8-96. AC Coupling Capacitors Requirements

PARAMETER	MIN	TYP	MAX	UNIT
PCIe AC coupling capacitor value	75		200	nF
PCIe AC coupling capacitor package size(1)		0402	0603	EIA(2)

(1) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair, placed side by side.
(2) EIA LxW units; that is, a 0402 is a 40x20 mil (thousandths of an inch) surface-mount capacitor.

8.17.3.2.2 Polarity Inversion

The PCIe specification requires polarity inversion support. This means, for layout purposes, polarity is unimportant since each signal can change its polarity on-die inside the chip. This means polarity within a lane is unimportant for layout.

8.17.3.3 Non-Standard PCIe Connections

The following sections contain suggestions for any PCIe connection that is ***not*** described in the official PCIe specification, such as an on-board device-to-device connection, or device-to-other PCIe-compliant processor connection.

8.17.3.3.1 PCB Stackup Specifications

Table 8-97 shows the stackup and feature sizes required for these types of PCIe connections.

Table 8-97. PCIe PCB Stackup Specifications

PARAMETER	MIN	TYP	MAX	UNIT
PCB Routing/Plane Layers	4	6	-	Layers
Signal Routing Layers	2	3	-	Layers
Number of ground plane cuts allowed within PCIe routing region	-	-	0	Cuts
Number of layers between PCIe routing area and reference plane(1)	-	-	0	Layers
PCB Routing clearance	-	4	-	Mils
PCB Trace width(2)	-	4	-	Mils
PCB BGA escape via pad size	-	20	-	Mils
PCB BGA escape via hole size	-	10		Mils
Processor BGA pad size(3)(4)		0.4		mm

(1) A reference plane may be a ground plane or the power plane referencing the PCIe signals.
(2) In breakout area.
(3) Non-solder mask defined pad.
(4) Per IPC-7351A BGA pad size guideline.

8.17.3.3.2 Routing Specifications

The PCIe data signal traces must be routed to achieve 100 Ω (±20%) differential impedance and 60 Ω (±15%) single-ended impedance. The single-ended impedance is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important. These requirements are the same as those recommended in the *PCIe Motherboard Checklist 1.0* document, available from PCI-SIG.

These impedances are impacted by trace width, trace spacing, distance between signals and referencing planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs result in as close to 100 Ω differential impedance and 60 Ω single-ended impedance as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

In general, closely coupled differential signal traces are not an advantage on PCBs. When differential signals are closely coupled, tight spacing and width control is necessary. Very small width and spacing variations affect impedance dramatically, so tight impedance control can be more problematic to maintain in production.

Loosely coupled PCB differential signals make impedance control much easier. Wider traces and spacing make obstacle avoidance easier, and trace width variations do not affect impedance as much; therefore, it is easier to maintain an accurate impedance over the length of the signal. The wider traces also show reduced skin effect and, therefore, often result in better signal integrity.

Table 8-98 shows the routing specifications for the PCIe data signals.

Table 8-98. PCIe Routing Specifications

PARAMETER	MIN	TYP	MAX	UNIT
PCIe signal trace length			10 (1)	Inches
Differential pair trace matching			10 (2)	Mils
Number of stubs allowed on PCIe traces (3)			0	Stubs
TX/RX pair differential impedance	80	100	120	Ω
TX/RX single ended impedance	51	60	69	Ω
Pad size of vias on PCIe trace			25 (4)	Mils
Hole size of vias on PCIe trace			14	Mils
Number of vias on each PCIe trace			3	Vias (5)
PCIe differential pair to any other trace spacing	2*DS (6)			

(1) Beyond this, signal integrity may suffer.
(2) For example, RXP0 within 10 Mils of RXN0.
(3) In-line pads may be used for probing.
(4) 35-Mil antipad max recommended.
(5) Vias must be used in pairs with their distance minimized.
(6) DS = differential spacing of the PCIe traces.

8.18 Serial ATA Controller (SATA)

The Serial ATA (SATA) peripheral provides a direct interface to one hard disk drive (SATA 300) or up to 15 hard disk drives using a Port Multiplier and supports the following features:

- Serial ATA 1.5 Gbps and 3 Gbps speeds
- Integrated PHY
- Integrated Rx and Tx data buffers
- Supports all SATA power management features
- Hardware-assisted native command queuing (NCQ) for up to 32 entries
- Supports port multiplier with command-based switching
- Activity LED support.

8.18.1 SATA Peripheral Register Descriptions

8.18.2 SATA Interface Design Guidelines

This section provides PCB design and layout guidelines for the SATA interface. The design rules constrain PCB trace length, PCB trace skew, signal integrity, cross-talk, and signal timing. Simulation and system design work has been done to ensure the SATA interface requirements are met.

A standard 100-MHz differential clock source must be used for SATA operation (for details, see Section 7.4.2, *SERDES_CLKN/P Input Clock*).

8.18.2.1 SATA Interface Schematic

Figure 8-89 shows the data portion of the SATA interface schematic. The specific pin numbers can be obtained from Table 3-26, *Serial ATA Terminal Functions*.

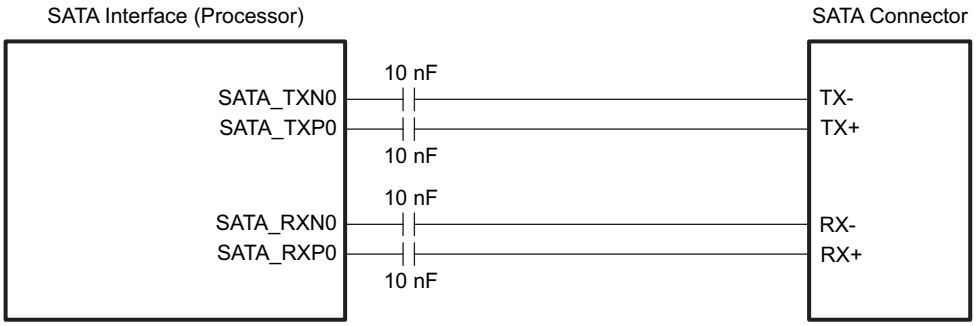

Figure 8-89. SATA Interface High-Level Schematic

8.18.2.2 Compatible SATA Components and Modes

Table 8-100 shows the compatible SATA components and supported modes. Note that the only supported configuration is an internal cable from the processor host to the SATA device.

Table 8-100. SATA Supported Modes

PARAMETER	MIN	MAX	UNIT	SUPPORTED
Transfer Rates	1.5	3.0	Gbps	
xSATA	-	-	-	No
Backplane	-	-	-	No
Internal Cable (iSATA)	-	-	-	Yes

8.18.2.3 PCB Stackup Specifications

Table 8-101 shows the PCB stackup and feature sizes required for SATA.

Table 8-101. SATA PCB Stackup Specifications

PARAMETER	MIN	TYP	MAX	UNIT
PCB routing/plane layers	4	6	-	Layers
Signal routing layers	2	3	-	Layers
Number of ground plane cuts allowed within SATA routing region	-	-	0	Cuts
Number of layers between SATA routing region and reference ground plane	-	-	0	Layers
PCB trace width, w	-	4	-	Mils
PCB BGA escape via pad size	-	20	-	Mils
PCB BGA escape via hole size	-	10		Mils
Processor BGA pad size (1)		0.4		mm

(1) NSMD pad, per IPC-7351A BGA pad size guideline.

8.18.2.4 Routing Specifications

The SATA data signal traces must be routed to achieve 100 Ω (±20%) differential impedance and 60 Ω (±15%) single-ended impedance. The single-ended impedance is required because differential signals are extremely difficult to closely couple on PCBs and, therefore, single-ended impedance becomes important. 60 Ω is chosen for the single-ended impedance to minimize problems caused by too low an impedance.

These impedances are impacted by trace width, trace spacing, distance to reference planes, and dielectric material. Verify with a PCB design tool that the trace geometry for both data signal pairs results in as close to 100 Ω differential impedance and 60 Ω single-ended impedance traces as possible. For best accuracy, work with your PCB fabricator to ensure this impedance is met.

Table 8-102 shows the routing specifications for the SATA data signals.

Table 8-102. SATA Routing Specifications

PARAMETER	MIN	TYP	MAX	UNIT
Processor-to-SATA header trace length			10 (1)	Inches
Number of stubs allowed on SATA traces (2)			0	Stubs
TX/RX pair differential impedance	80	100	120	Ω
TX/RX single ended impedance	51	60	69	Ω
Number of vias on each SATA trace			3	Vias (3)
SATA differential pair to any other trace spacing	2*DS (4)			

(1) Beyond this, signal integrity may suffer.
(2) In-line pads may be used for probing.
(3) Vias must be used in pairs with their distance minimized.
(4) DS = differential spacing of the SATA traces.

8.18.2.5 Coupling Capacitors

AC coupling capacitors are required on the receive data pair. Table 8-103 shows the requirements for these capacitors.

Table 8-103. SATA AC Coupling Capacitors Requirements

PARAMETER	MIN	TYP	MAX	UNIT
SATA AC coupling capacitor value	1	10	12	nF
SATA AC coupling capacitor package size(1)		0402	0603	EIA(2)

(1) The physical size of the capacitor should be as small as practical. Use the same size on both lines in each pair, placed side by side.
(2) EIA LxW units; that is, a 0402 is a 40 x 20 mil surface-mount capacitor.

8.19 Serial Peripheral Interface (SPI)

The SPI is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (4 to 32 bits) to be shifted into and out of the device at a programmed bit-transfer rate. The SPI is normally used for communication between the device and external peripherals. Typical applications include an interface-to-external I/O or peripheral expansion via devices such as shift registers, display drivers, SPI EEPROMs, and Analog-to-Digital Converters (ADCs).

The SPI supports the following features:

- Master/Slave operation
- Four chip selects for interfacing/control to up to four SPI Slave devices and connection to a single external Master
- 32-bit shift register
- Buffered receive/transmit data register per channel (1 word deep), FIFO size is 64 bytes
- Programmable SPI configuration per channel (clock definition, enable polarity and word width)
- Supports one interrupt request and two DMA requests per channel.

For more detailed information on the SPI, see the *Multichannel Serial Port Interface (McSPI)* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.19.1 SPI Peripheral Register Descriptions

8.19.2 SPI Electrical Data/Timing

Table 8-105. Timing Requirements for SPI - Master Mode

(see Figure 8-90 and Figure 8-91)

NO.				OPP100/120/166		UNIT
				MIN	MAX	
MASTER: SPI0, SPI1, SPI2 (M0) and SPI3 (M0)1 LOAD AT A MAXIMUM OF 5 pF						
1	$t_{c(SPICLK)}$	Cycle time, SPI_CLK(1)(2)		20.8(3)		ns
2	$t_{w(SPICLKL)}$	Pulse duration, SPI_CLK low(1)		0.5*P - 1(4)		ns
3	$t_{w(SPICLKH)}$	Pulse duration, SPI_CLK high(1)		0.5*P - 1(4)		ns
4	$t_{su(MISO-SPICLK)}$	Setup time, SPI_D[x] valid before SPI_CLK active edge(1)	SPI0, SPI1	2.29		ns
			SPI2, SPI3	4		
5	$t_{h(SPICLK-MISO)}$	Hold time, SPI_D[x] valid after SPI_CLK active edge(1)		2.67		ns
6	$t_{d(SPICLK-MOSI)}$	Delay time, SPI_CLK active edge to SPI_D[x] transition(1)		-3.57	3.57	ns
7	$t_{d(SCS-MOSI)}$	Delay time, $\overline{\text{SPI\_SCS[x]}}$ active edge to SPI_D[x] transition			3.57	ns
8	$t_{d(SCS-SPICLK)}$	Delay time, $\overline{\text{SPI\_SCS[x]}}$ active to SPI_CLK first edge(1)	MASTER_PHA0(5)	B-4.2(6)		ns
			MASTER_PHA1(5)	A-4.2(7)		ns
9	$t_{d(SPICLK-SCS)}$	Delay time, SPI_CLK last edge to $\overline{\text{SPI\_SCS[x]}}$ inactive(1)	MASTER_PHA0(5)	A-4.2(7)		ns
			MASTER_PHA1(5)	B-4.2(6)		ns
MASTER: SPI0, SPI1, SPI2 (M0) and SPI3 (M0) LOAD AT MAX 25pF MASTER: SPI2 (M1, M2, M3) and SPI3 (M1, M2, M3) 1 to 4 LOAD AT 5 to 25pF						
1	$t_{c(SPICLK)}$	Cycle time, SPI_CLK(1)(2)		41.7(8)		ns
2	$t_{w(SPICLKL)}$	Pulse duration, SPI_CLK low(1)		0.5*P - 2(4)		ns
3	$t_{w(SPICLKH)}$	Pulse duration, SPI_CLK high(1)		0.5*P - 2(4)		ns
4	$t_{su(MISO-SPICLK)}$	Setup time, SPI_D[x] valid before SPI_CLK active edge(1)	SPI0, SPI1	4		ns
			SPI2, SPI3	6		
5	$t_{h(SPICLK-MISO)}$	Hold time, SPI_D[x] valid after SPI_CLK active edge(1)		3.8		ns
6	$t_{d(SPICLK-MOSI)}$	Delay time, SPI_CLK active edge to SPI_D[x] transition(1)		-5.5	5.5	ns
7	$t_{d(SCS-MOSI)}$	Delay time, $\overline{\text{SPI\_SCS[x]}}$ active edge to SPI_D[x] transition			5.5	ns
8	$t_{d(SCS-SPICLK)}$	Delay time, $\overline{\text{SPI\_SCS[x]}}$ active to SPI_CLK first edge(1)	MASTER_PHA0(5)	B-3.5(6)		ns
			MASTER_PHA1(5)	A-3.5(7)		ns
9	$t_{d(SPICLK-SCS)}$	Delay time, SPI_CLK last edge to $\overline{\text{SPI\_SCS[x]}}$ inactive(1)	MASTER_PHA0(5)	A-3.5(7)		ns
			MASTER_PHA1(5)	B-3.5(6)		ns

(1) This timing applies to all configurations regardless of SPI_CLK polarity and which clock edges are used to drive output data and capture input data.
(2) Related to the SPI_CLK maximum frequency.
(3) Maximum frequency = 48 MHz
(4) P = SPICLK period.
(5) SPI_CLK phase is programmable with the PHA bit of the SPI_CH(i)CONF register.
(6) B = (TCS + 0.5) * TSPICLKREF * F_{ratio}, where TCS is a bit field of the SPI_CH(i)CONF register and F_{ratio} = Even ≥2.
(7) When P = 20.8 ns, A = (TCS + 1) * TSPICLKREF, where TCS is a bit field of the SPI_CH(i)CONF register. When P > 20.8 ns, A = (TCS + 0.5) * F_{ratio} * TSPICLKREF, where TCS is a bit field of the SPI_CH(i)CONF register.
(8) Maximum frequency = 24 MHz

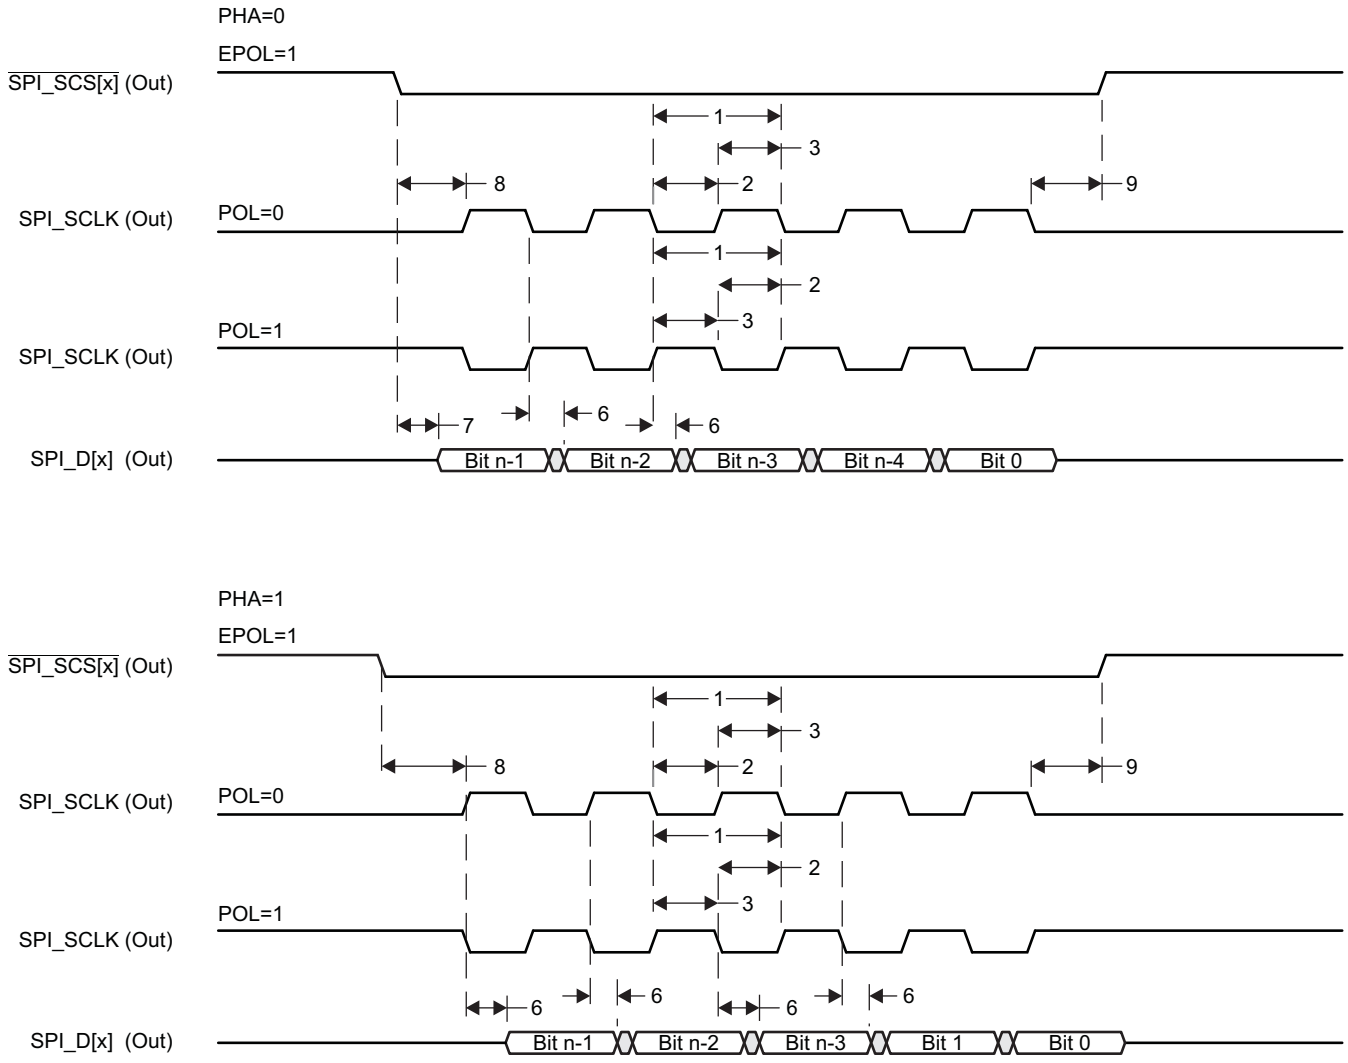

Figure 8-90. SPI Master Mode Transmit Timing

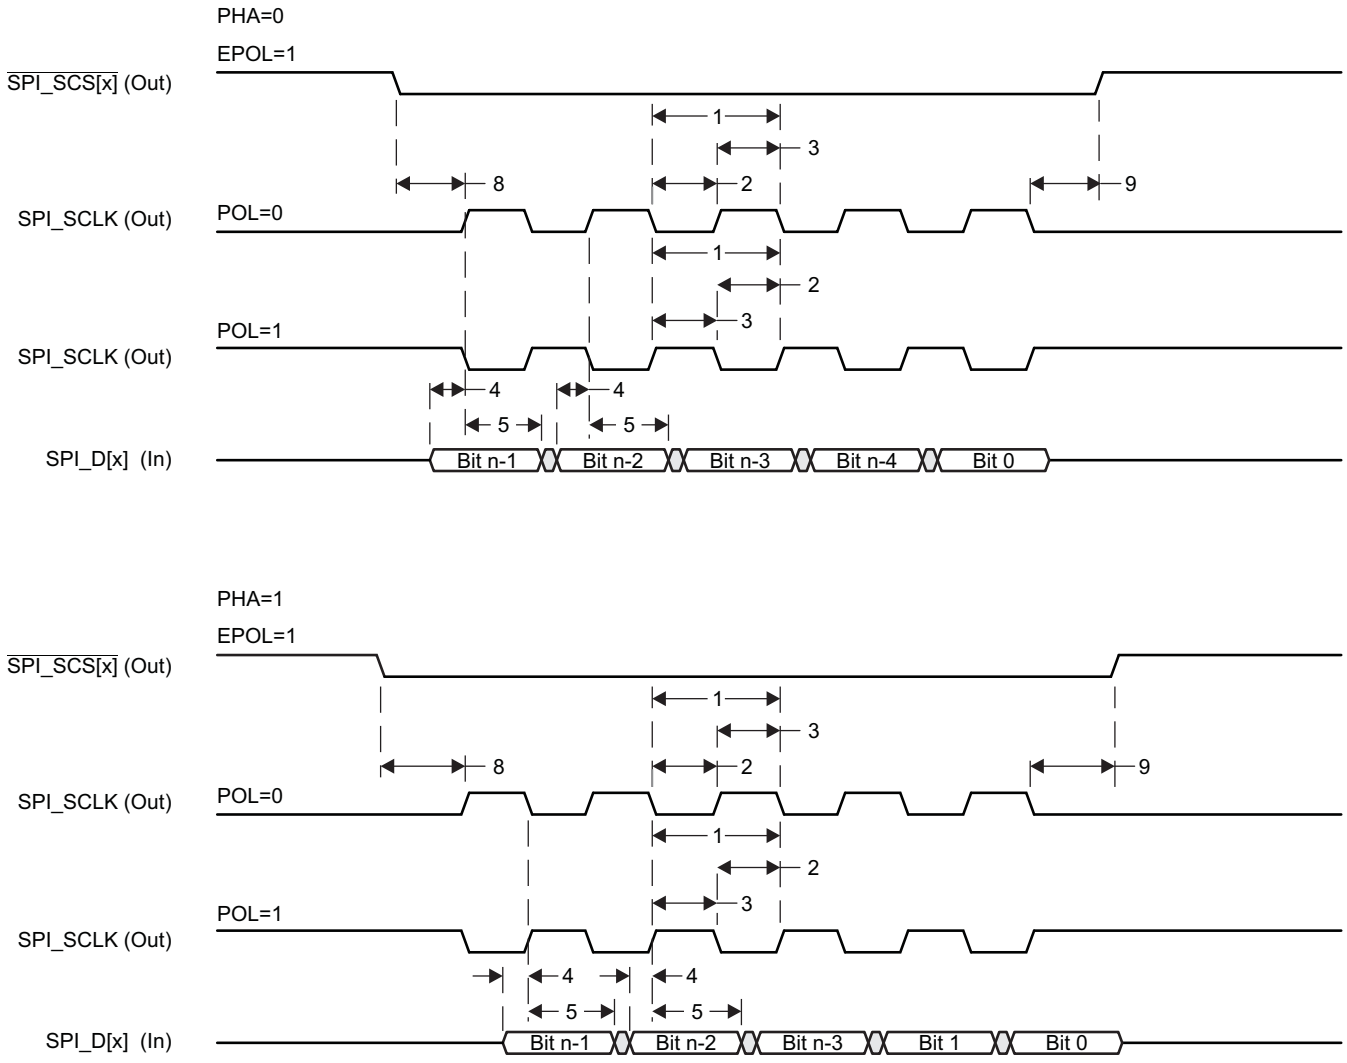

Figure 8-91. SPI Master Mode Receive Timing

Table 8-106. Timing Requirements for SPI - Slave Mode

(see Figure 8-92 and Figure 8-93)

NO.			OPP100/120/166		UNIT
			MIN	MAX	
1	$t_{c(SPICLK)}$	Cycle time, SPI_CLK (1) (2)	62.5 (3)		ns
2	$t_{w(SPICLKL)}$	Pulse duration, SPI_CLK low (1)	0.5*P - 3 (4)		ns
3	$t_{w(SPICLKH)}$	Pulse duration, SPI_CLK high (1)	0.5*P - 3 (4)		ns
4	$t_{su(MOSI-SPICLK)}$	Setup time, SPI_D[x] valid before SPI_CLK active edge (1)	12.92		ns
5	$t_{h(SPICLK-MOSI)}$	Hold time, SPI_D[x] valid after SPI_CLK active edge (1)	12.92		ns
6	$t_{d(SPICLK-MISO)}$	Delay time, SPI_CLK active edge to SPI_D[x] transition (1)	-4.00	17.1	ns
7	$t_{d(SCS-MISO)}$	Delay time, $\overline{\text{SPI\_SCS[x]}}$ active edge to SPI_D[x] transition (5)		17.1	ns
8	$t_{su(SCS-SPICLK)}$	Setup time, $\overline{\text{SPI\_SCS[x]}}$ valid before SPI_CLK first edge (1)	12.92		ns

(1) This timing applies to all configurations regardless of SPI_CLK polarity and which clock edges are used to drive output data and capture input data.
(2) Related to the input maximum frequency supported by the SPI module.
(3) Maximum frequency = 16 MHz
(4) P = SPICLK period.
(5) PHA = 0; SPI_CLK phase is programmable with the PHA bit of the SPI_CH(i)CONF register.

Table 8-106. Timing Requirements for SPI - Slave Mode (continued)

(see Figure 8-92 and Figure 8-93)

NO.			OPP100/120/166		UNIT
			MIN	MAX	
9	$t_{h(SPICLK-SCS)}$	Hold time, $\overline{SPI\_SCS[x]}$ valid after SPI_CLK last edge (1)	12.92		ns

8.20 Timers

The device has eight 32-bit general-purpose (GP) timers (TIMER8 - TIMER1) that have the following features:

- TIMER8, TIMER1 are for software use and do not have an external connection
- Dedicated input trigger for capture mode and dedicated output trigger/pulse width modulation (PWM) signal
- Interrupts generated on overflow, compare, and capture
- Free-running 32-bit upward counter
- Supported modes:
  - Compare and capture modes
  - Auto-reload mode
  - Start-stop mode
- TIMER[8:1] functional clock is sourced from either the DEVOSC, AUXOSC, AUD_CLK2/1/0, TCLKIN, or SYSCLK18 27 MHz as selected by the timer clock multiplexers.
- On-the-fly read/write register (while counting)
- Generates interrupts to the ARM, DSP, and Media Controller.

The device has one system watchdog timer that have the following features:

- Free-running 32-bit upward counter
- On-the-fly read/write register (while counting)
- Reset upon occurrence of a timer overflow condition
- The system watchdog timer has two possible clock sources:
  - RCOSC32K oscillator
  - RTCDIVIDER
- The watchdog timer is used to provide a recovery mechanism for the device in the event of a fault condition, such as a non-exiting code loop.

For more detailed information on the GP and Watchdog Timers, see the *Timers* and *Watchdog Timer* chapters of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

NO.	PARAMETER		OPP100/120/166		UNIT
			MIN	MAX	
3	$t_{w(EVTOH)}$	Pulse duration, high	4P-3(1)		ns
4	$t_{w(EVTOL)}$	Pulse duration, low	4P-3(1)		ns

(1) P = module clock.

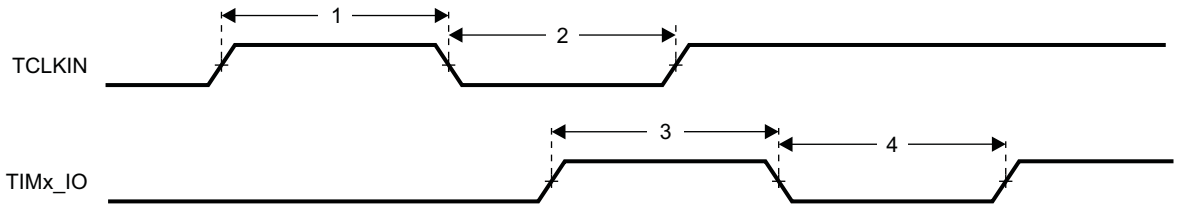

Figure 8-94. Timer Timing

8.21 Universal Asynchronous Receiver/Transmitter (UART)

The UART performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the CPU. The device provides up to six UART peripheral interfaces, depending on the selected pin multiplexing.

Each UART has the following features:

- Selectable UART/IrDA (SIR/MIR)/CIR modes
- Dual 64-entry FIFOs for received and transmitted data payload
- Programmable and selectable transmit and receive FIFO trigger levels for DMA and interrupt generation
- Baud-rate generation based upon programmable divisors N (N=1…16384)
- Two DMA requests and one interrupt request to the system
- Can connect to any RS-232 compliant device.

UART functions include:

- Baud-rate up to 3.6 Mbit/s on UART0, UART1, and UART2
- Baud-rate up to 12 Mbit/s on UART3, UART4, and UART5
- Programmable serial interfaces characteristics
  - 5, 6, 7, or 8-bit characters
  - Even, odd, or no parity-bit generation and detection
  - 1, 1.5, or 2 stop-bit generation
  - Flow control: hardware (RTS/CTS) or software (XON/XOFF)
- Additional modem control functions (UART0_DTR, UART0_DSR, UART0_DCD, and UART0_RIN) for UART0 only; UART1, UART2, UART3, UART4, and UART5 do not support full-flow control signaling.

IR-IrDA functions include:

- Support of IrDA 1.4 slow infrared (SIR, baud-rate up to 115.2 Kbits/s), medium infrared (MIR, baud-rate up to 1.152 Mbits/s) and fast infrared (FIR baud-rate up to 4.0 Mbits/s) communications
- Supports framing error, cyclic redundancy check (CRC) error, illegal symbol (FIR), and abort pattern (SIR, MIR) detection
- 8-entry status FIFO (with selectable trigger levels) available to monitor frame length and frame errors.

IR-CIR functions include:

- Consumer infrared (CIR) remote control mode with programmable data encoding
- Free data format (supports any remote control private standards)
- Selectable bit rate and configurable carrier frequency.

For more detailed information on the UART peripheral, see the *UART/IrDA/CIR Module* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.21.1 UART Peripheral Register Descriptions

8.21.2 UART Electrical/Data Timing

Table 8-109. Timing Requirements for UART

(see Figure 8-95)

NO.			OPP100/120/166		UNIT
			MIN	MAX	
4	$t_{w(RX)}$	Pulse width, receive data bit, 15/30/100pF high or low	0.96U[1]	1.05U[1]	ns
5	$t_{w(CTS)}$	Pulse width, receive start bit, 15/30/100pF high or low	0.96U[1]	1.05U[1]	ns
	$t_{d(RTS-TX)}$	Delay time, transmit start bit to transmit data	P[2]		ns
	$t_{d(CTS-TX)}$	Delay time, receive start bit to transmit data	P[2]		ns

(1) U = UART baud time = 1/programmed baud rate
(2) P = Clock period of the reference clock (FCLK, usually 48 MHz).

Table 8-110. Switching Characteristics Over Recommended Operating Conditions for UART

(see Figure 8-95)

NO.	PARAMETER			OPP100/120/166		UNIT
				MIN	MAX	
	$f_{(baud)}$	Maximum programmable baud rate	15 pF (UART0/1/2)		5	MHz
			15 pF (UART3/4/5)		12	
			30 pF		0.23	
			100 pF		0.115	
2	$t_{w(TX)}$	Pulse width, transmit data bit, 15/30/100 pF high or low		U - 2[1]	U + 2[1]	ns
3	$t_{w(RTS)}$	Pulse width, transmit start bit, 15/30/100 pF high or low		U - 2[1]	U + 2[1]	ns

(1) U = UART baud time = 1/programmed baud rate

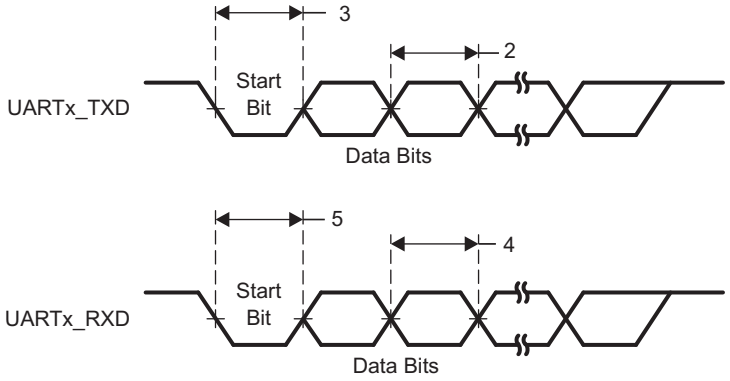

Figure 8-95. UART Timing

8.22 Universal Serial Bus (USB2.0)

The device includes two USB2.0 modules which support the *Universal Serial Bus Specification Revision 2.0.* The following are some of the major USB features that are supported:

- USB 2.0 peripheral at high speed (HS: 480 Mbps) and full speed (FS: 12 Mbps)
- USB 2.0 host at HS, FS, and low speed (LS: 1.5 Mbps)
- Each endpoint (other than endpoint 0, control only) can support all transfer modes (control, bulk, interrupt, and isochronous)
- Supports high-bandwidth ISO mode
- Supports 16 Transmit (TX) and 16 Receive (RX) endpoints including endpoint 0
- FIFO RAM
  - 32K endpoint
  - Programmable size
- Includes two integrated PHYs
- RNDIS-like mode for terminating RNDIS-type protocols without using short-packet termination for support of MSC applications.
- USB OTG extensions — session request protocol (SRP) and host negotiation protocol (HNP)

The USB2.0 peripherals do not support the following features:

- On-chip charge pump (VBUS Power must be generated external to the device.)
- RNDIS mode acceleration for USB sizes that are not multiples of 64 bytes
- Endpoint max USB packet sizes that do not conform to the USB 2.0 spec (for FS/LS: 8, 16, 32, 64, – and 1023 are defined; for HS: 64, 128, 512, and 1024 are defined

For more detailed information on the USB2.0 peripheral, see the *Universal Serial Bus (USB)* chapter of the *TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual* (Literature Number: SPRUGZ8).

8.22.2 USB2.0 Electrical Data/Timing

Table 8-118. Switching Characteristics Over Recommended Operating Conditions for USB2.0

(see Figure 8-96)

NO.	PARAMETER		OPP100/120/166						UNIT
			LOW SPEED 1.5 Mbps		FULL SPEED 12 Mbps		HIGH SPEED 480 Mbps		
			MIN	MAX	MIN	MAX	MIN	MAX	
1	$t_{r(D)}$	Rise time, USBx_DP and USBx_DM signals(1)	75	300	4	20	0.5		ns
2	$t_{f(D)}$	Fall time, USBx_DP and USBx_DM signals(1)	75	300	4	20	0.5		ns
3	t_{rfM}	Rise/Fall time, matching(2)	80	125	90	111	–	–	%
4	V_{CRS}	Output signal cross-over voltage(1)	1.3	2	1.3	2	–	–	V
5	$t_{jr(source)NT}$	Source (Host) Driver jitter, next transition		2		2		(3)	ns
	$t_{jr(FUNC)NT}$	Function Driver jitter, next transition		25		2		(3)	ns
6	$t_{jr(source)PT}$	Source (Host) Driver jitter, paired transition(4)		1		1		(3)	ns
	$t_{jr(FUNC)PT}$	Function Driver jitter, paired transition		10		1		(3)	ns
7	$t_{w(EOPT)}$	Pulse duration, EOP transmitter	1250	1500	160	175	–	–	ns
8	$t_{w(EOPR)}$	Pulse duration, EOP receiver(5)	670		82		–		ns
9	$t_{(DRATE)}$	Data Rate		1.5		12		480	Mbps
10	Z_{DRV}	Driver Output Resistance	–	–	28	49.5	40.5	49.5	Ω
11	Z_{INP}	Receiver Input Impedance(6)	300		300	–	–	–	kΩ

(1) Low Speed: C_L = 200 pF, Full Speed: C_L = 50 pF, High Speed: C_L = 50 pF
(2) $t_{RFM} = (t_r/t_f) \times 100$. [Excluding the first transaction from the Idle state.]
(3) For more detailed information, see the Universal Serial Bus Specification Revision 2.0, Chapter 7, *Electrical*.
(4) $t_{jr} = t_{px(1)} - t_{px(0)}$
(5) Must accept as valid EOP.
(6) These values do not include the external resistors required per USB 2.0 specification.

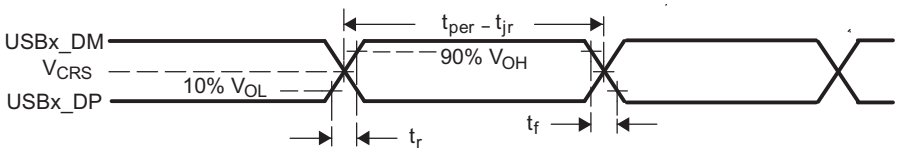

Figure 8-96. USB2.0 Integrated Transceiver Interface Timing

For more detailed information on USB2.0 board design, routing, and layout guidelines, see the *USB 2.0 Board Design and Layout Guidelines* Application Report (Literature Number: SPRAAR7).

9 Device and Documentation Support

9.1 Device Support

9.1.1 Development Support

TI offers an extensive line of development tools, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules. The support documentation for the tools is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE).

The following products support development of TMS320DM814x processor applications:

Software Development Tools: Code Composer Studio™ Integrated Development Environment (IDE): including Editor C/C++/Assembly Code Generation, and Debug plus additional development tools Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DaVinci Digital Media Processor application.

Hardware Development Tools: Extended Development System (XDS™) Emulator

For a complete listing of development-support tools for the DM814x DaVinci™ Digital Media Processor platform, visit the Texas Instruments website at www.ti.com. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

9.1.2 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all DSP + ARM devices and support tools. Each DSP + ARM commercial family member has one of three prefixes: TMX, TMP, or TMS (for example, TMX320DM8148BCYE0). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

TMX Experimental device that is not necessarily representative of the final device's electrical specifications.

TMP Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification.

TMS Fully-qualified production device.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully qualified development-support product.

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

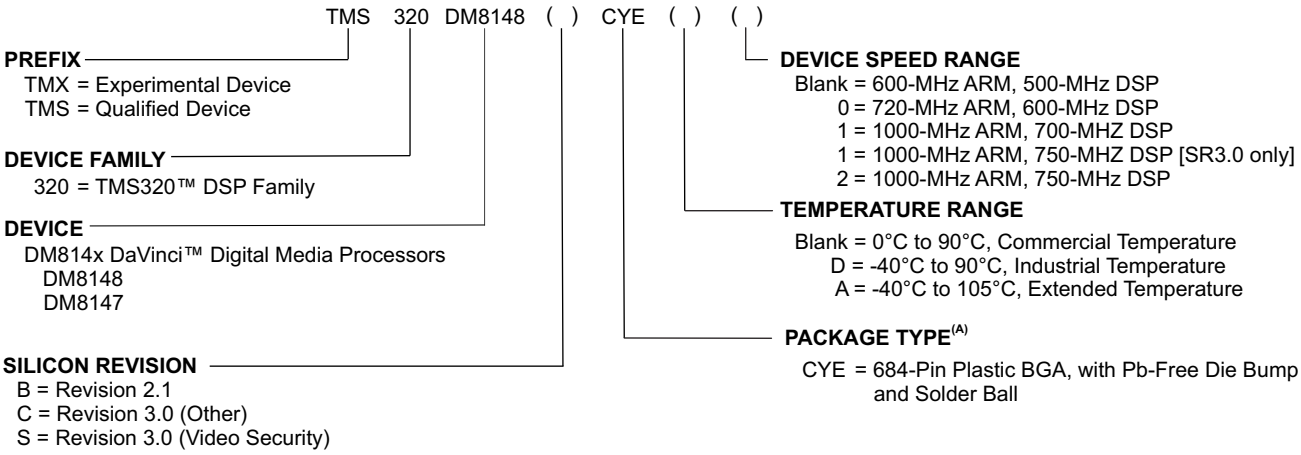
Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, CYE), the temperature range (for example, "Blank" is the commercial temperature range), and the device speed range in megahertz (for example, "Blank" is the default [600-MHz ARM, 500-MHz DSP]).

Figure 9-1 provides a legend for reading the complete device name for any TMS320DM814x platform member.

For device part numbers and further ordering information of TMS320DM814x devices in the CYE package type, see the TI website (www.ti.com) or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the *TMS320DM814x DaVinci™ Digital Media Processors Silicon Errata (Silicon Revision 2.1)* (Literature Number: SPRZ343).



A. BGA = Ball Grid Array
B. For actual device part numbers (P/Ns) and ordering information, see the TI website (http://www.ti.com).
C. The TEMPERATURE RANGE values are specified over operating junction temperature.

Figure 9-1. Device Nomenclature(B)(C)

9.2 Documentation Support

The following document describes the DM814x DaVinci™ Digital Media Processors.

SPRUGZ8 ***TMS320DM814x DaVinci Digital Media Processors Technical Reference Manual.***

9.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E Community ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

TI Embedded Processors Wiki ***Texas Instruments Embedded Processors Wiki.*** Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

10 Mechanical

The device package has been specially engineered with a new technology called Via Channel™. The Via Channel technology allows larger than normal PCB via sizes and reduced PCB signal layers to be used in a PCB design with this 0.8-mm pitch package, and will substantially reduce PCB costs. Via Channel also allows PCB routing in only two signal layers (four layers total) due to the increased layer efficiency of the Via Channel™ BGA technology.

10.1 Thermal Data for CYE-04 (Top Hat)

Table 10-1. Thermal Resistance Characteristics (PBGA Package) [CYE-04] (Thinner Top Hat)

NO.			°C/W(1)	AIR FLOW (m/s)(2)
1	$R\Theta_{JC}$	Junction-to-case	0.39	N/A
2	$R\Theta_{JB}$	Junction-to-board	3.87	N/A
3	$R\Theta_{JA}$	Junction-to-free air	11.67	0.00
5	$R\Theta_{JMA}$	Junction-to-moving air	8.59	1.00
6			7.80	2.00
7			7.33	3.00
8	Psi_{JT}	Junction-to-package top	0.19	0.00
10			0.20	1.00
11			0.20	2.00
12			0.21	3.00
13	Psi_{JB}	Junction-to-board	3.44	0.00
15			3.37	1.00
16			3.26	2.00
17			3.17	3.00

(1) These measurements were conducted in a JEDEC defined 2S2P system (with the exception of the Theta JC [$R\Theta_{JC}$] measurement, which was conducted in a JEDEC defined 1S0P system) and will change based on environment as well as application. For more information, see these EIA/JEDEC standards:
- JESD51-2, *Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air)*
- JESD51-3, *Low Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-9, *Test Boards for Area Array Surface Mount Packages*

Power dissipation of 2 W and an ambient temperature of 70ºC is assumed.

(2) m/s = meters per second

10.2 Packaging Information

The following packaging information and addendum reflect the most current data available for the designated device(s). This data is subject to change without notice and without revision of this document.

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TMX320DM8148BCYE	ACTIVE	FCBGA	CYE	684		TBD	Call TI	Call TI	0 to 90		Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

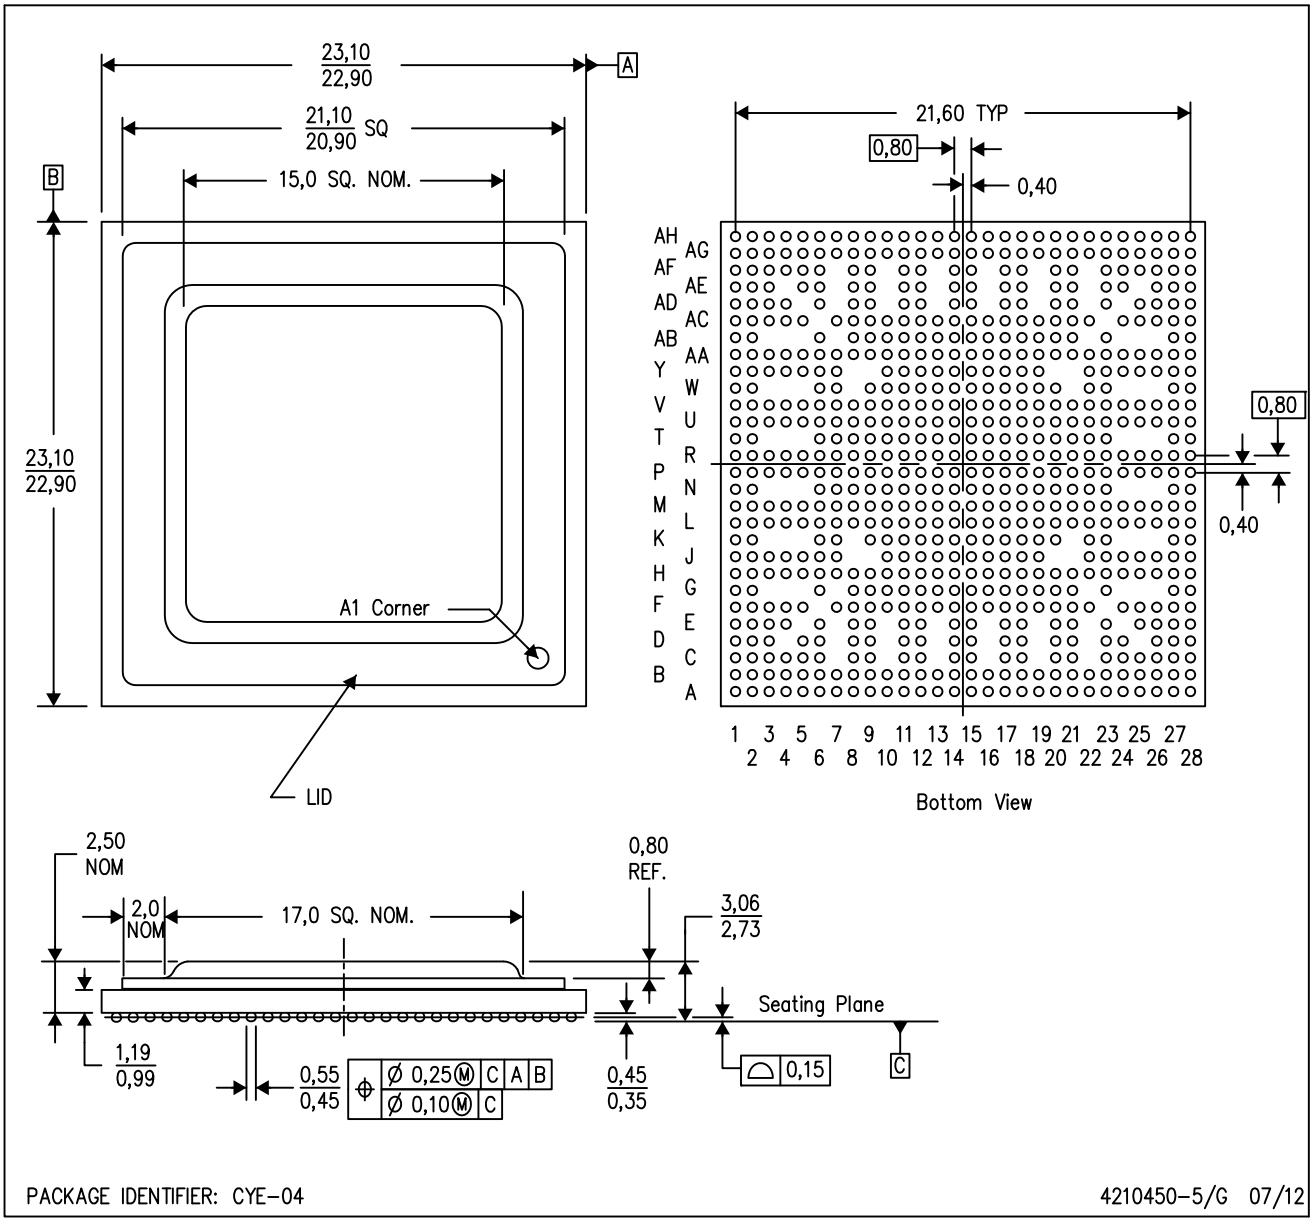
(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

CYE (S–PBGA–N684) PLASTIC BALL GRID ARRAY



NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Flip chip application only.
D. Thermally enhanced plastic package with lid.
E. Pb–free die bump and solder ball.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
