

Precision, Zero-Drift, High-Voltage, Programmable Gain Instrumentation Amplifier

Check for Samples: [PGA281](#)

FEATURES

- **Wide Input Range:** $\pm 15.5\text{ V}$ at $\pm 18\text{ V}$ Supply
- **Binary Gain Steps:** 128 V/V to $\frac{1}{8}\text{ V/V}$
- **Additional Scaling Factor:** 1 V/V and $1\frac{1}{2}\text{ V/V}$
- **Low Offset Voltage:** 5 μV at $G = 128$
- **Near-Zero Long-Term Drift of Offset Voltage**
- **Near-Zero Gain Drift:** 0.5 ppm/ $^{\circ}\text{C}$
- **Excellent Linearity:** 1.5 ppm
- **Excellent CMRR:** 140 dB
- **High Input Impedance**
- **Very Low 1/f Noise**
- **Differential Signal Output**
- **Overload Detection**
- **TSSOP-16 Package**

APPLICATIONS

- **High-Precision Signal Instrumentation**
- **Multiplexed Data Acquisition**
- **Medical Instrumentation**
- **Test and Measurement Equipment**
- **Differential or Single-Ended ADC Drivers**
- **Strain Gauge Amplifiers**
- **Industrial Process Control**

DESCRIPTION

The PGA281 is a high-precision instrumentation amplifier with a digitally-controllable gain and signal-integrity test capability. This device uses proprietary autozeroing techniques to offer low offset voltage, near-zero offset and gain drift, excellent linearity, and nearly no 1/f noise.

The PGA281 is optimized to provide an excellent common-mode rejection of greater than 110 dB ($G = 1$) over a wide frequency range. Superior common-mode and supply rejection supports high-resolution, precise measurement. The 36-V supply capability and wide, high-impedance input range comply with requirements for universal signal measurement.

The PGA281 offers multiple internal gain options from $\frac{1}{8}\text{ V/V}$ (attenuation) to 176 V/V, making this a universal, high-performance, analog front-end suitable for a wide variety of applications. The fully differential, rail-to-rail output is designed to easily interface a wide range of input signals to the low-voltage domain of high-resolution analog-to-digital converters (ADCs).

The PGA281 is available in a TSSOP-16 package and is specified over a temperature range of -40°C to $+105^{\circ}\text{C}$.

RELATED PRODUCTS

PRODUCT	FEATURES
ADS1259	23-bit resolution, $\Delta\Sigma$ analog-to-digital converter
INA333	Chopper-stabilized instrumentation amplifier, RR I/O, 5-V single supply
PGA204	High-precision PGA; $G = 1, 10, 100,$ and 1000
PGA280	Zero-Drift, 36-V, PGA, SPI, GPIOs, input switch matrix

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE INFORMATION⁽¹⁾

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Over operating free-air temperature range, unless otherwise noted.

		VALUE	UNIT
Supply voltage	VSN to VSP	40	V
	VSON to VSOP, and VSON to DVDD	6	V
Signal input terminals, voltage ⁽²⁾		VSN – 0.5 to VSP + 0.5	V
Signal input terminals, current ⁽²⁾		±10	mA
Output short-circuit ⁽³⁾		Continuous	
Operating temperature		–55 to +140	°C
Storage temperature		–65 to +150	°C
Junction temperature		+150	°C
Electrostatic discharge (ESD) ratings	Human body model (HBM)	2000	V

- (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.
- (2) Terminals are diode-clamped to the power-supply (VON and VOP) rails. Signals that can swing more than 0.5 V beyond the supply rails must be current-limited.
- (3) Short-circuit to VSON or VSOP, respectively, VSON or DVDD.

THERMAL INFORMATION

THERMAL METRIC ⁽¹⁾		PGA281	UNITS

APPLICATION INFORMATION

DESCRIPTION

The PGA281 is a universal high-voltage instrumentation amplifier with digital gain control. It offers excellent dc precision and long-term stability using modern chopper technology with internal filters that minimize chopper-related noise. The input gain extends from $\frac{1}{8}$ V/V (attenuation) to 128 V/V in binary steps. The output stage offers a gain multiplying factor of 1 V/V or $1\frac{3}{8}$ V/V for optimal gain adjustment. The output stage connects to the low-voltage (for example: 5 V or 3 V) supply. [Figure 37](#) shows a block diagram of the PGA281.

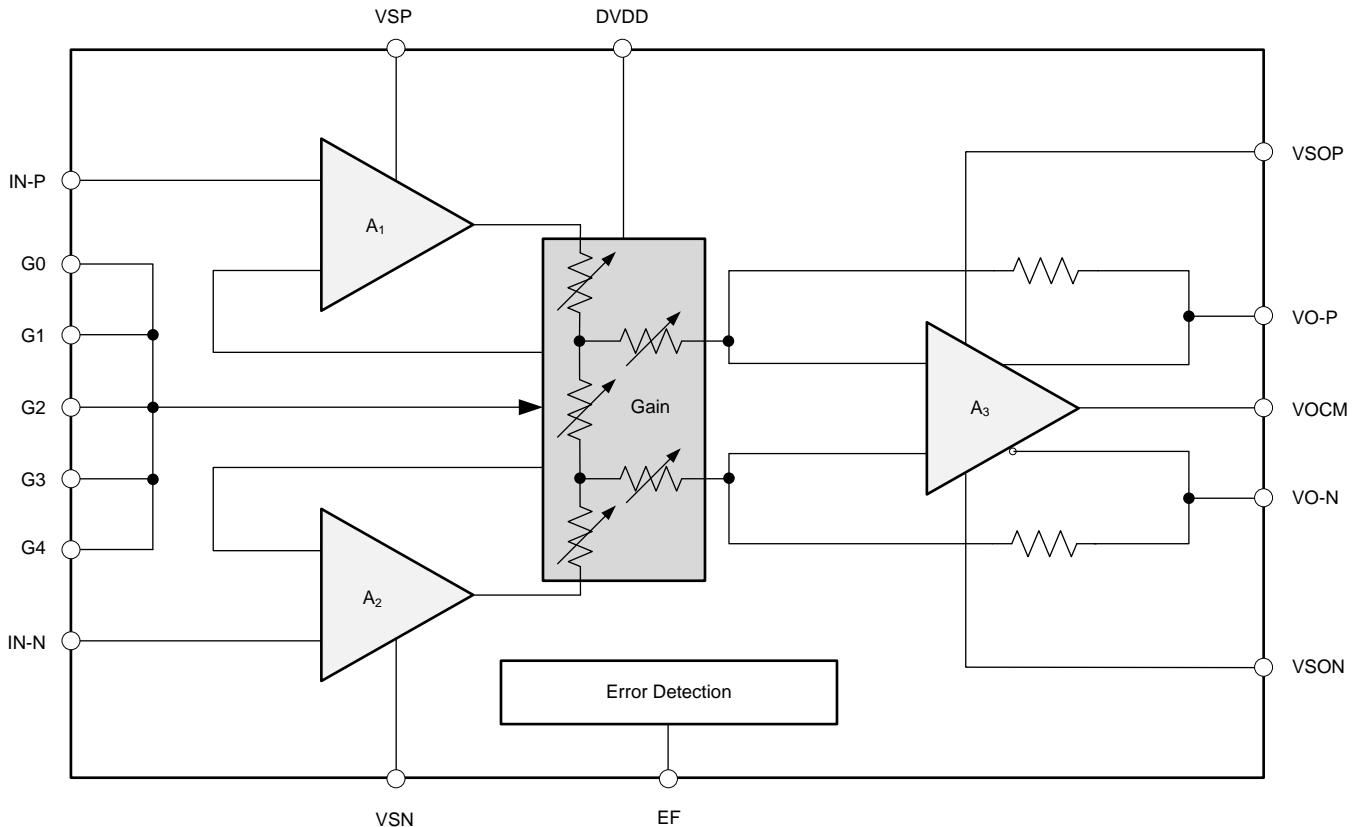

Figure 37. Block Diagram

The supply voltage of up to ± 18 V offers a wide common-mode range with high input impedance; therefore, large common-mode noise signals and offsets can be suppressed.

The fully differential signal output is compatible with the inputs of modern high-resolution and high-accuracy analog-to-digital converters (ADCs), including delta-sigma ($\Delta\Sigma$) as well as successive-approximation register (SAR) converters. The supply voltage for the output stage is normally connected to the converter supply, thus preventing signal overloads from the high-voltage analog supply.

Internal error detection in the input and output stage monitors signal integrity and provides information about the input signal condition on the EF pin output.

The gain is set using digital inputs G4:G0 (pins 3, 4, 5, 6, and 7). Select the desired gain according to the settings in [Table 1](#). Logic high and low levels are with respect to the voltage on DVDD (pin 1) and VSON (pin 12). The limits are specified in the *Digital I/O* section of the [Electrical Characteristics](#).

FUNCTIONAL BLOCKS

The PGA281 has two high-impedance input amplifiers (see [Figure 37](#), A_1 and A_2) that are symmetrical and low noise, with excellent dc precision. These amplifiers are connected to a resistor network and provide a gain range from 128 V/V down to an attenuation of $\frac{1}{8}$ V/V. The PGA281 architecture rejects common-mode offsets and noise over a wide bandwidth.

The signal inputs are diode-clamped to the supply rails. To provide overvoltage protection, place external resistors in series to the inputs. Limit current into the input pins to ≤ 10 mA.

The output stage (A_3) provides a fully-differential symmetrical signal around the output reference pin, VOCM. The VOCM pin is a high-impedance input and must be driven with an external voltage, typically close to midsupply. The 3-V or 5-V supply of the converter or amplifier, following the PGA281 outputs, is normally connected to VSOP and VSON; this configuration shares a common supply voltage and protects the circuit from overloads. The fully-differential signal avoids coupling of noise and errors from the supply and ground, and allows large signal swing without the risk of nonlinearities that arise when driving near the supply rails.

The PGA281 signal path has several internal nodes monitored for critical overload conditions. The input amplifiers detect signal overvoltage and overload as a result of high gain. The output stage also detects clipping.

Input Amplifiers and Gain Network

The high-precision input amplifiers present very low dc error and drift as a result of a modern chopper technology with an embedded synchronous filter that removes nearly all chopping noise. This topology reduces flicker ($1/f$) noise to a minimum, and therefore enables the precise measurement of small dc-signals with high resolution, accuracy, and repeatability. The chopping frequency of 250 kHz is derived from an internal 1-MHz clock.

The gain network for the binary gain steps connects to the input amplifiers, thus providing the best possible signal-to-noise ratio (SNR) and dc accuracy up to the highest gains. Gain is digitally programmable by pins G4:G0. The input stage provides selectable gains (in V/V): 128, 64, 32, 16, 8, 4, 2, 1, $\frac{1}{2}$, $\frac{1}{4}$, and $\frac{1}{8}$. The G4 pin provides an additional gain multiplication factor on the output stage of 1 V/V or $1\frac{3}{8}$ V/V. This allows for optimal gain fine-tuning, and increases the maximum gain of the PGA281 to 176 V/V.

Programmable gain amplifiers such as the PGA281 use internal resistors to set the gain. Consequently, quiescent current is increased by the current that passes through these resistors. The largest amplitude may increase the supply current by ± 0.4 mA. For example, in a maximum overload condition, with a gain of 128 V/V, and with each of the inputs connected to the opposite supply voltage, a current of approximately 27 mA is measured. External resistors in series with the input pins are normally present and help to avoid this extreme condition. This current is only limited by the internal 600 Ω .

Digital Inputs

Digital inputs G0, G1, G2, G3, and G4, select the gain according to the settings shown in [Table 1](#). Logic high and low levels are with respect to the voltage on DVDD (pin 1) and VSON (pin 12). The logic limits are specified in the *Digital I/O* section of the [Electrical Characteristics](#). Approximately 0.2 μ A flows out of the digital input pins when a logic '0' is applied. Logic input current is nearly zero with a logic '1' input.

Digital inputs G4:G0 are not latched; a change in logic inputs immediately selects a new gain. Switching time of the logic is approximately 1 μ s. The time to respond to gain change is effectively the time it takes the amplifier to settle to a new output voltage in the newly selected gain (see the settling times specified in the *Frequency Response* section of the [Electrical Characteristics](#)). Many applications use an external logic latch to access gain control data from a high-speed data bus. Using an external latch isolates the high-speed digital bus from sensitive analog circuitry. Place the latch circuitry as far as practical from analog circuitry.

Output Stage

The output stage power supply is usually connected to the low-voltage supply (normally 3 V or 5 V) that is used by the subsequent signal path of the system. This design prevents overloading of the low-voltage signal path.

The output signal is fully differential around the common-mode voltage (VOCM). The VOCM input pin is typically connected to the midsupply voltage in order to offer the widest signal amplitude range. VOCM is a high-impedance input that requires an external connection to a voltage within the supply boundaries. If the VOCM pin is left floating, the output common-mode voltage is undefined, and the amplifier will not operate properly. The usable voltage range for the VOCM input is specified in the [Electrical Characteristics](#) and must be observed.

The output stage can be set to a gain of 1V/V or 1½V/V with the G4 pin logic level. This option allows for additional gain fine tuning.

Figure 38 shows how signal outputs VOP and VON swing symmetrically around VOCM. The signal is represented as the voltage between the two outputs and does not require an accurate VOCM. Therefore, the signal output does not include ground noise or grounding errors. Noise or drift on VOCM is normally rejected by the common-mode rejection capability of the subsequent signal stage. By using a differential output stage, the PGA281 achieves large voltage swings on a single 3-V or 5-V supply.

Figure 38. Differential Output Voltage

The output signal is internally monitored for two error conditions: clipping of the signal to the supply rail and overcurrent. In fault conditions, an error flag bit is set high until the fault is removed.

Electrical Overstress

Designers often ask questions about the capability of an amplifier to withstand electrical overstress. These questions tend to focus on the device inputs, but may involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal ESD protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

Having a good understanding of this basic ESD circuitry and its relevance to an electrical overstress event is helpful. [Figure 39](#) illustrates the ESD circuits contained in the PGA281. The ESD protection circuitry involves several current-steering diodes connected from the input and output pins and routed back to the internal power-supply lines. This protection circuitry is intended to remain inactive during normal circuit operation.

Figure 39. Equivalent Internal ESD Circuitry

The PGA281 input terminals are protected with internal diodes connected to VSP and VSN. If the input signal voltage exceeds the power-supply voltage (VSP and VSN), limit the current to less than 10 mA to protect the internal clamp diodes. This current-limiting can usually be accomplished with a series input resistor.

EMI Rejection

The PGA281 uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI from sources such as wireless communications, and densely-populated boards with a mix of analog signal chain and digital components. The PGA281 is specifically designed to minimize susceptibility to EMI by incorporating an internal low-pass filter. Depending on the end-system requirements, additional EMI filters may be required near the signal inputs of the system, as well as incorporating known good practices such as using short traces, low-pass filters, and damping resistors combined with parallel and shielded signal routing. Texas Instruments developed a method to accurately measure the immunity of an amplifier over a broad frequency spectrum, extending from 10 MHz to 6 GHz. This method uses EMI rejection ratio (EMIRR) to quantify the PGA281 ability to reject EMI. [Figure 40](#) and [Figure 41](#) show the PGA281 EMIRR graph for both differential and common-mode EMI rejection across this frequency range. [Table 2](#) shows the EMIRR values for the PGA281 at frequencies commonly encountered in real-world applications. Applications listed in [Table 2](#) may be centered on or operated near the particular frequency shown.

Figure 40. Common Mode EMIRR Testing

Figure 41. Differential Mode (IN-P) EMIRR Testing

Table 2. PGA281 EMIRR for Frequencies of Interest

FREQUENCY	APPLICATION OR ALLOCATION	DIFFERENTIAL (IN-P) EMIRR	COMMON-MODE EMIRR
400 MHz	Mobile radio, mobile satellite, space operation, weather, radar, ultra-high frequency (UHF) applications	84.3 dB	101.8 dB
900 MHz	Global system for mobile communications (GSM) applications, radio communication, navigation, GPS (to 1.6 GHz), GSM, aeronautical mobile, UHF applications	103.3 dB	125.6 dB
1.8 GHz	GSM applications, mobile personal communications, broadband, satellite, L-band (1 GHz to 2 GHz)	112.5 dB	131.8 dB
2.4 GHz	802.11b, 802.11g, 802.11n, Bluetooth®, mobile personal communications, industrial, scientific and medical (ISM) radio band, amateur radio and satellite, S-band (2 GHz to 4 GHz)	114.6 dB	122.4 dB
3.6 GHz	Radiolocation, aero communication and navigation, satellite, mobile, S-band	108.9 dB	113.5 dB
5.0 GHz	802.11a, 802.11n, aero communication and navigation, mobile communication, space and satellite operation, C-band (4 GHz to 8 GHz)	118.7 dB	123.3 dB

Output Filter

The PGA281 uses a chopper-stabilized architecture for excellent dc stability over temperature and life of operation. The device also removes 1/f frequency (flicker) noise, and therefore enables both high resolution and high repeatability for dc measurements. Although the chopper noise components are internally filtered, a minimal residual amount of high-frequency switching noise appears at the signal outputs. Placing an external, passive, low-pass filter after the output stage is recommended to remove this switching noise; Figure 42 shows two examples. This filter can also be used to isolate or decouple the charge switching pulses of an ADC input.

Figure 42. Typical Examples of Recommended Output Filters

Single-Ended Output

The output stage of the PGA281 is designed for highest precision. The fully-differential output avoids grounding errors and noise, and delivers twice the signal amplitude compared to single-ended signals. However, if desired, a single-ended output (VOP or VON) can be measured, referred to the voltage at the V_{OCM} pin. The output stage errors now relate to half the signal amplitude and half the signal gain. Figure 43 shows how the unused output is unconnected, but not disconnected from error detection. The usable voltage range for the V_{OCM} input is specified in the [Electrical Characteristics](#) and must be observed; that is, the output swing (of both outputs) should not saturate to the supply. Separate specifications for offset voltage and drift indicate higher offset voltage at lower gains because some error sources are not cancelled in the output stage connected in single-ended mode. Note that the gain is one-half of the gain set in reference to the gain table (see [Table 1](#)).

Figure 43. Single-Ended Connection Example

ERROR INDICATORS

Error Flag Detection

The PGA281 is designed for high dc precision and universal use, but it also allows monitoring of signal integrity. This error flag pin (EF, pin 2) alerts if an error is detected in one of the diagnostic areas specified in Figure 44. The error flag is a logic low during normal operation, but alarms to a logic high level when in an error state. The pin returns to normal operation (logic low) after the error state is removed. This added feature supports fully automated system setup and diagnostic capability while maintaining signal integrity. Figure 44 illustrates the diagnostic points available for error detection in the device architecture.

Figure 44. Diagnostic Points for Error Detection

Input Clamp Conduction

The input clamp protects the precision input amplifier from large voltages between the inputs caused by a fast signal slew rate in the input. This clamp circuit conducts current from the input pins during overload. Current flowing through the clamp can influence the signal source and cause long settling delays on passive input signal filters. The current is limited by internal resistors of approximately 600 Ω. Note that dynamic overload can result from the difference signal as well as the common-mode signal.

The input clamp turns on when the input signal slew rate is greater than ± 1 V/ μ s and faster than the amplifier slew rate (specified in the *Frequency Response* section of the [Electrical Characteristics](#)). Appropriate input filtering avoids input clamp activation.

Input Overvoltage

The input amplifier can only operate at high performance within a certain input voltage range inside the supply rail. The error flag (EF pin) alarm indicates a loss of performance as a result of the input voltage or the amplifier output approaching the rail.

Gain Network Overload

The gain setting network is protected against overcurrent conditions that occur because of an improper gain setting. The current into the resistors is proportional to the voltage between both inputs and the internal resistor; a low resistor value results in high gains. The error flag alarms if such an overload condition results from an improper gain setting.

Output Amplifier

The output stage is monitored for signal clipping to the supply rail and for overcurrent conditions.

POWER SUPPLY

The PGA281 requires three supply voltages: the high-voltage analog supply, the low-voltage output amplifier supply, and the digital I/O supply. This architecture allows an optimal interface (level-shift) to the different supply domains.

The high-voltage analog supplies, VSP and VSN, power the high-voltage input stage section. The substrate of the device is connected to VSN; therefore, it must be connected to the most negative potential.

The low-voltage analog output supplies, VSOP and VSON, operate within the high-voltage supply boundaries with two minimal limitations:

1. The usable range for VSON is from a minimum 5 V below VSP to as low as VSN. This 5 V provides the headroom for the output supply voltage of +2.7 V to +5 V. Even with less than a 5-V supply, this voltage difference is required for proper operation.
2. The common-mode control input, VOXM, requires a voltage at least 2 V less than VSP in order to support internal rail-to-rail performance.

These limitations are applicable when using a minimum supply or an extremely asymmetrical high-voltage supply. In most practical cases, VSON is connected to the ground of the system 3-V or 5-V supply.

VSOP can be turned on first or can be higher than VSP without harm, but operation fails if VSP and VSN are not present.

Observe the maximum voltage applied between VSOP and VSON because there is no internal protection.

Positive digital supply DVDD and digital ground VSON can also be set within the boundaries of VSP and VSN. However, DVDD must be 1 V less than VSP. DVDD can be turned on without the analog supply being present and is operational. Observe the maximum supply voltage because there is no internal protection. VSOP can be connected with DVDD if desired.

The negative digital supply is connected to the VSON pin. Take care if using split supplies on the VSOP and VSON pin because the logic low and high thresholds are determined by DVDD and VSON. In normal operation, VSON is connected to the system ground.

VSN is connected to the substrate; therefore, the voltage at VSON must not turn on the substrate diode to VSN. Use external Schottky diodes from VSON to VSN to prevent this condition.

The PGA281 uses an internal chopper-stabilized architecture, and requires good supply decoupling. RC decoupling using series resistors in the supply is recommended. Series resistors can be in the range of 15 Ω to 22 Ω . RC decoupling also prevents a very fast rise time of the supply voltage, thus avoiding parasitic currents in the device. Connecting supply wires into an already turned-on supply (very fast rise time) without such a filter can damage the device as a result of voltage overshoot and parasitic charge currents. Figure 45 shows an example of a supply connection using RC bypass filters. DVDD may not need decoupling, but if the digital supply is noisy, a filter is recommended.

NOTE

Rise and fall times for the high-voltage supplies must be slower than 1 V/ μ s.

NOTE: The supply voltages shown are only example values.

Figure 45. Supply Connection Example Using RC Bypass Filters for Good Decoupling

Quiescent Current

The PGA281 uses internal resistor networks and switches to set the signal gain. Consequently, the current through the resistor network may vary with the gain and signal amplitude. Under normal operation, the gain-related current is low (less than 400 μA). However, in signal overload conditions while a high gain is selected, this amount of current may increase.

Settling Time

The PGA281 provides very low drift and low noise, and therefore allows repeatable settling to a precise value. Signal-related load and power-dissipation variables have minimal effect on device accuracy.

Overload Recovery

Overload conditions can vary widely and there are multiple points in an instrumentation amplifier that can be overloaded. During input overload, the PGA281 folds the output signal partially back as a result of the differential signal structure and summing, but the error flag indicates such fault conditions. The amplifier recovers safely after removing the overload condition, as long as it is within the specified operating range as shown in [Figure 46](#).

Figure 46. Input Clipping: Negative Side

Avoid dynamic overload by using adequate signal filtering that reduces the input slew rate to the slew rate of the amplifier.

Input Bias Current Return Path

The input impedance of the PGA281 is extremely high; greater than 1 GΩ. However, make sure to provide a path for the input bias current of both inputs. This input bias current is typically 300 pA. A high input impedance means that this input bias current changes very little with varying input voltage.

Input circuitry must provide a path for this input bias current for proper operation. Figure 47 shows various provisions for an input bias current path. Without a bias current path, the inputs float to a potential that exceeds the common-mode range of the PGA281, and the input amplifiers saturate. If the differential source resistance is low, connect the bias current return path to one input (as shown in the thermocouple example in Figure 47). With higher source impedance, using two equal resistors provides a balanced input with the possible advantage of lower input offset voltage as a result of bias current and better high-frequency common-mode rejection.

Figure 47. Providing an Input Common-Mode Current Path

Application Examples

Multiplexed Data Acquisition

Figure 48 shows the PGA281 used in a multiplexed data-acquisition application.

Using TINA-TI™ SPICE-Based Analog Simulation Program with the PGA281

TINA is a simple, powerful, and easy-to-use circuit simulation program based on a SPICE engine. TINA-TI is a free, fully functional version of the TINA software, preloaded with a library of macromodels in addition to a range of both passive and active models. It provides all the conventional dc, transient, and frequency-domain analysis of SPICE, as well as additional design capabilities.

Available as a [free download from the Analog eLab Design Center](#), TINA-TI offers extensive post-processing capability that allows users to format results in a variety of ways.

Virtual instruments offer users the ability to select input waveforms and probe circuit nodes, voltages, and waveforms, creating a dynamic quick-start tool.

NOTE

NOTE: These files require that either the TINA software (from DesignSoft) or TINA-TI software be installed. Download the free TINA-TI software from the [TINA-TI folder](#).

Two-Terminal Programmable Logic Controller

The circuit in Figure 51 is used to convert inputs of ± 10 V, ± 5 V, or ± 20 mA to an output voltage range from 0 V to 5 V. The input selection depends on the settings of the switch and the PGA281 gain. Further explanation, as well as the TINA-TI simulation circuit, is provided in the compressed file that can be downloaded at the following link: [PGA281 PLC Circuit](#).

Figure 51. Two-Terminal, Programmable Logic Controller (PLC) Input

RTD Amplifier

An example of the PGA281 used in an RTD-amplification application is shown in [Figure 52](#). Click the following link to download the TINA-TI file: [PGA281 RTD](#).

Figure 52. RTD Amplifier

High-Side Current Sensing

[Figure 53](#) shows an example of how the PGA281 can be used for high-side current sensing. The load current (I_{LOAD}) creates a voltage drop across the shunt resistor (R_{SHUNT}). This voltage can be amplified or attenuated by the PGA281. The wide gain options and excellent common-mode rejection of the PGA281 make it ideal for this type of application. Click the following link to download the TINA-TI file: [PGA281 Current Sense](#).

Figure 53. High-Side Current Sensing

Bridge Amplifier

An example of the PGA281 used in a bridge or strain gauge amplification application is shown in [Figure 54](#). Click the following link to download the TINA-TI file: [PGA281 Bridge Amplifier](#).

Figure 54. Programmable Bridge Amplifier

Evaluation Module

The PGA281EVM provides basic functional evaluation of the PGA281. A picture of the PGA281EVM is provided in [Figure 55](#).

Figure 55. PGA281 Evaluation Module

The PGA281 evaluation module provides the following features:

- Easy access to nodes with surface-mount test points
- Convenient input and output filtering
- Simple gain setting and error flag indication

The [PGA281EVM User Guide \(SBOU130\)](#), available for download at www.ti.com provides instructions on how to set up the device for evaluation. The user guide also includes schematics, layout, and a bill of materials (BOM).

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
PGA281AIPW	ACTIVE	TSSOP	PW	16	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	PGA 281	Samples
PGA281AIPWR	ACTIVE	TSSOP	PW	16	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	PGA 281	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
