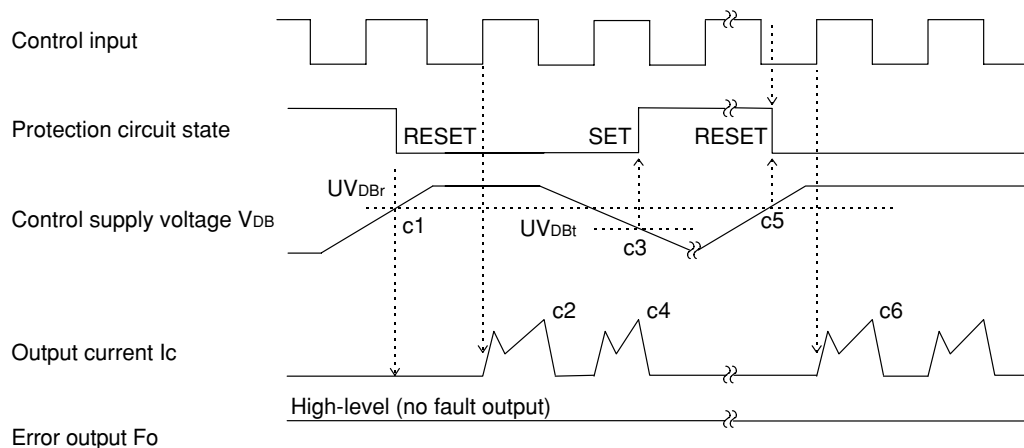

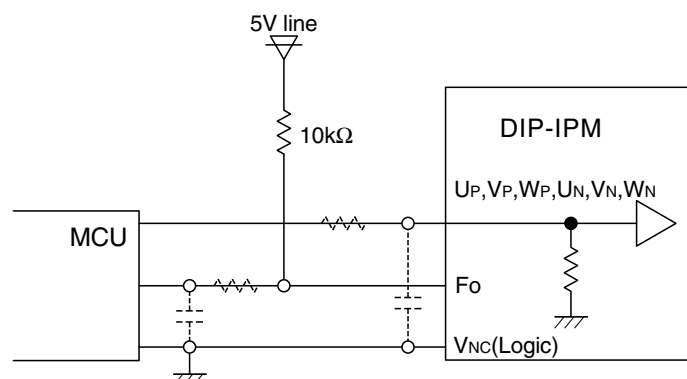

Fig. 6 RECOMMENDED CPU I/O INTERFACE CIRCUIT

Note : The setting of RC coupling at each input (parts shown dotted) depends on the PWM control scheme and the wiring impedance of the printed circuit board.

The DIP-IPM input section integrates a 2.5kΩ (min) pull-down resistor. Therefore, when using an external filtering resistor, pay attention to the turn-on threshold voltage.

Fig. 7 WIRING CONNECTION OF SHUNT RESISTOR

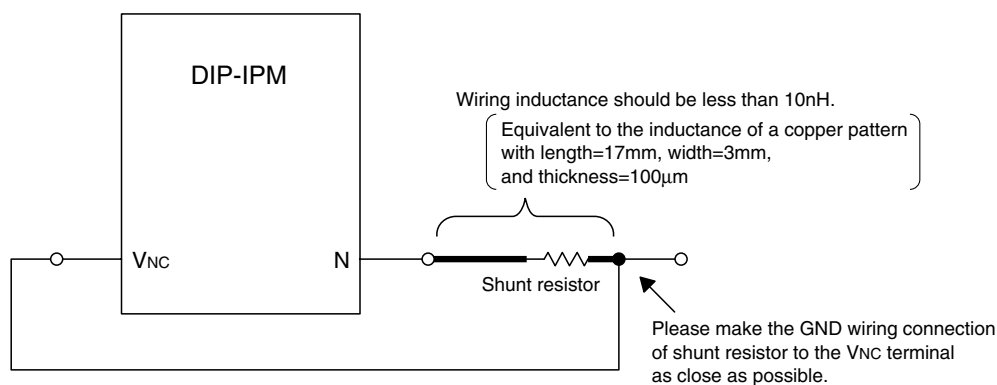

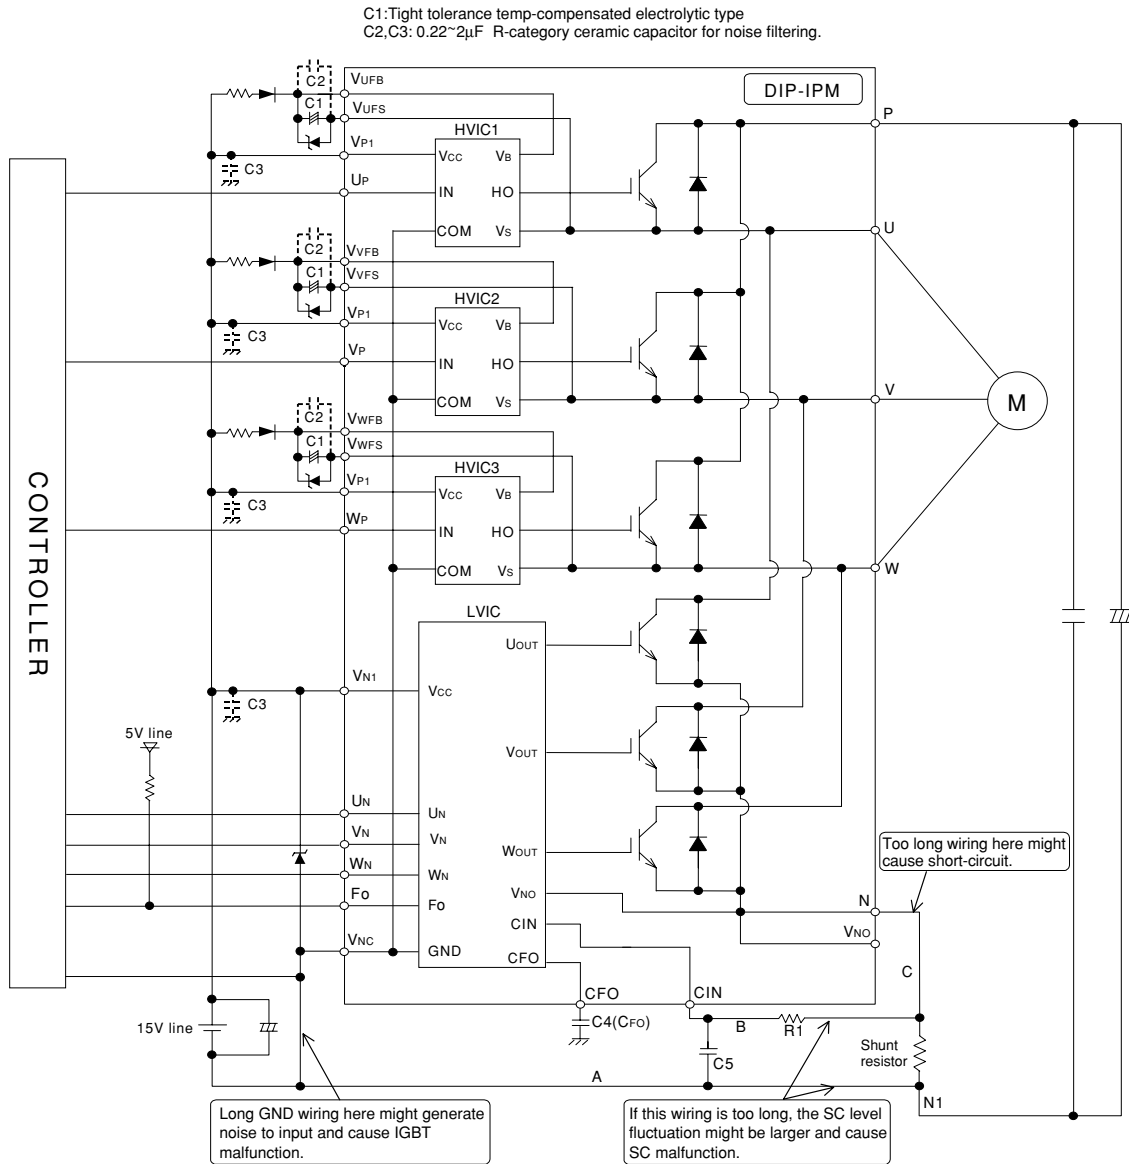

Fig. 8 TYPICAL DIP-IPM APPLICATION CIRCUIT EXAMPLE

Note 1: To prevent the input signals oscillation, the wiring of each input should be as short as possible. (Less than 2cm)

2: By virtue of integrating an application specific type HVIC inside the module, direct coupling to MCU terminals without any opto-coupler or transformer isolation is possible.

3: Fo output is open drain type. This signal line should be pulled up to the positive side of the 5V power supply with approximately 10kΩ resistor.

4: Fo output pulse width is determined by the external capacitor between Cfo and Vnc terminals (Cfo). (Example : Cfo = 22 nF → tFo = 1.8 ms (typ.))

5: The logic of input signal is high-active. The DIP-IPM input signal section integrates a 2.5kΩ (min) pull-down resistor. Therefore, when using external filtering resistor, care must be taken to satisfy the turn-on threshold voltage requirement.

6: To prevent malfunction of protection, the wiring of A, B, C should be as short as possible.

7: Please set the C5R1 time constant in the range 1.5~2μs.

8: Each capacitor should be located as nearby the pins of the DIP-IPM as possible.

9: To prevent surge destruction, the wiring between the smoothing capacitor and the P, N1 pins should be as short as possible. Approximately a 0.1~0.22μF snubber capacitor between the P-N1 pins is recommended.

10: Please leave Vno open. (no connect)

11: To prevent ICs from surge destruction, it is recommended to insert a Zener diode (24V, 1W) nearby each pair of supply terminals.
