

## 3-Pin Microprocessor Power Supply Supervisors

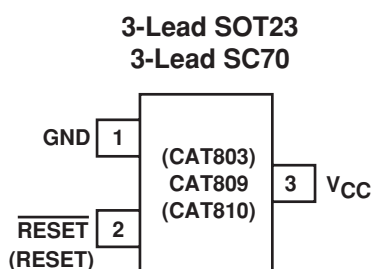

### FEATURES

- Precision monitoring of
  - +5.0V (-5%, -10%, -20%),
  - +3.3V (-5%, -10%),
  - +3.0V (-10%) and
  - +2.5V (-5%) power supplies
- Offered in three output configurations:
  - CAT803: Open-Drain Active LOW reset
  - CAT809: Push-Pull Active LOW reset
  - CAT810: Push-Pull Active HIGH reset
- Direct replacements for the MAX803, MAX809 and MAX810 in applications operating over the industrial temperature range
- Reset valid down to  $V_{CC} = 1.0V$
- 6 $\mu A$  power supply current
- Power supply transient immunity
- Industrial temperature range: -40°C to +85°C
- Available in RoHS-compliant SOT-23 and SC-70 packages

### APPLICATIONS

- Computers
- Servers
- Laptops
- Cable modems
- Wireless communications
- Embedded control systems
- White goods
- Power meters
- Intelligent instruments
- PDAs and handheld equipment

### PIN CONFIGURATION

### DESCRIPTION

The CAT803, CAT809, and CAT810 are supervisory circuits that monitor power supplies in digital systems. The CAT803, CAT809, and CAT810 are direct replacements for the MAX803, MAX809 and MAX810 in applications operating over the industrial temperature range.

These devices generate a reset signal, which is asserted while the power supply voltage is below a preset threshold level and for at least 140 ms after the power supply level has risen above that level. The underlying floating gate technology, AE<sup>2</sup>(TM) used by Catalyst Semiconductor, makes it possible to offer any custom reset threshold value. Seven industry standard threshold levels are offered to support +5.0V, +3.3V, +3.0V and +2.5V systems.

The CAT803 has an open-drain  $\overline{RESET}$  output (active LOW). The CAT803 requires a pull-up resistor on the reset output.

The CAT809 features a push-pull  $\overline{RESET}$  output (active LOW) and the CAT810 features a push-pull RESET output (active HIGH).

Fast transients on the power supply are ignored and the output is guaranteed to be in the correct state at  $V_{CC}$  levels as low as 1.0V.

The CAT803, CAT809, and CAT810 are available in both the compact 3-pin SOT-23 and SC-70 packages.

For Ordering Information details, see page 11 & 12.

### PIN DESCRIPTIONS

Pin Number			Name	Description
CAT803	CAT809	CAT810		
1	1	1	GND	Ground
2	2	—	$\overline{\text{RESET}}$	Active LOW reset. $\overline{\text{RESET}}$ is asserted if $V_{CC}$ falls below the reset threshold and remains low for at least 140ms after $V_{CC}$ rises above the reset threshold.
—	—	2	RESET	Active HIGH reset. RESET is asserted if $V_{CC}$ falls below the reset threshold and remains high for at least 140ms after $V_{CC}$ rises above the reset threshold.
3	3	3	$V_{CC}$	Power supply voltage that is monitored.

## DETAILED DESCRIPTIONS

### RESET TIMING

The reset signal is asserted LOW for the CAT803/CAT809 and HIGH for the CAT810 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 140ms after the power supply voltage has risen above the threshold.

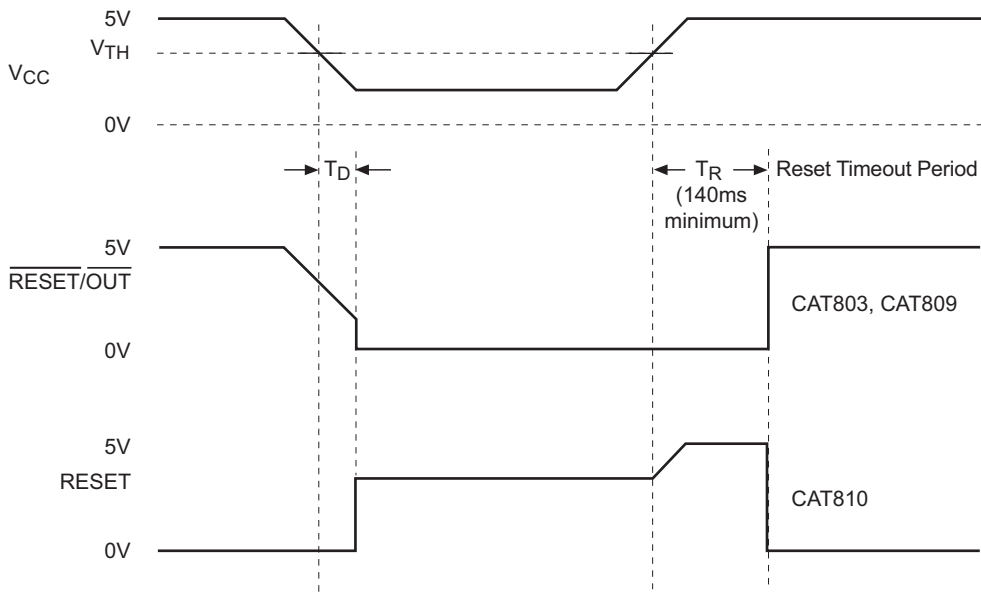

Figure 1. Reset Timing Diagram

### $V_{CC}$ TRANSIENT RESPONSE

The CAT803/CAT809/CAT810 protect  $\mu\text{Ps}$  against brownout failure. Short duration transients of 4 $\mu\text{sec}$  or less and 100mV amplitude typically do not cause a false RESET.

Figure 2 shows the maximum pulse duration of negative-going  $V_{CC}$  transients that do not cause a reset condition.

As the amplitude of the transient goes further below the threshold (increasing  $V_{TH} - V_{CC}$ ), the maximum pulse duration decreases. In this test, the  $V_{CC}$  starts from an initial voltage of 0.5V above the threshold and drops below it by the amplitude of the overdrive voltage ( $V_{TH} - V_{CC}$ ).

Figure 2. Maximum Transient Duration Without Causing a Reset Pulse vs. Reset Comparator Overdrive

**VALID RESET WITH  $V_{CC}$  UNDER 1.0V**

To ensure that the CAT809  $\overline{\text{RESET}}$  pin is in a known state when  $V_{CC}$  is under 1.0V, a  $>10k\Omega$  pull-down resistor between  $\overline{\text{RESET}}$  pin and GND is recommended. For the CAT810, a pull-up resistor from RESET pin to  $V_{CC}$  is needed.

Figure 3.  $\overline{\text{RESET}}$  Valid with  $V_{CC}$  Under 1.0V

Figure 4. RESET Valid with  $V_{CC}$  Under 1.1V

**BI-DIRECTIONAL RESET PIN INTERFACING**

The CAT809/810 can interface with  $\mu\text{P}/\mu\text{C}$  bi-directional reset pins by connecting a  $4.7k\Omega$  resistor in series with the CAT809/810 reset output and the  $\mu\text{P}/\mu\text{C}$  bi-directional reset pin.

### CAT803 OPEN-DRAIN $\overline{\text{RESET}}$ APPLICATION

The CAT803 features an open-drain  $\overline{\text{RESET}}$  output and therefore needs a pull-up resistor on the output for proper operation, as shown on Figure 6. An advantage of the open-drain output includes the ability to “wire AND” several outputs together to form an inexpensive logic circuit. It is also possible to have the pull-up resistor connected to a different supply which can be higher than the CAT803  $V_{CC}$  pin. The value of the pull-up resistor is not critical in most applications, typical values being between 5k $\Omega$  and 10k $\Omega$ .
