

**300mA RF ULDO REGULATOR****AP2210****General Description**

The AP2210 is a 300mA ULDO regulator which provides very low noise, ultra low dropout voltage (typically 250mV at 300mA), very low standby current (1 $\mu$ A maximum) and excellent power supply ripple rejection (PSRR 75dB at 100Hz) in battery powered applications, such as handsets, PDAs and in noise sensitive applications, such as RF electronics.

The AP2210 also features individual logic compatible enable/shutdown control inputs, a low power shutdown mode for extended battery life, over current protection, over temperature protection, as well as reversed-battery protection.

The AP2210 has 2.5V, 2.8V, 3.0V, 3.3V, 3.6V, 4.0V, 5.0V and ADJ versions.

The AP2210 is available in space saving SOT-23-3 and SOT-23-5 packages.

**Features**

- Up to 300mA Output Current
- Excellent ESR Stability
- Low Standby Current
- Low Dropout Voltage:  $V_{DROP}=250mV$  at 300mA
- High Output Accuracy:  $\pm 1\%$
- Good Ripple Rejection Ability: 75dB at 100Hz and  $I_{OUT}=100\mu A$
- Tight Load and Line Regulation
- Low Temperature Coefficient
- Over Current Protection
- Thermal Protection
- Reverse-battery Protection
- Logic-controlled Enable

**Applications**

- Cellular Phones
- Cordless Phones
- Wireless Communicators
- PDAs/Palmtops
- PC Mother Board
- Consumer Electronics

## Pin Configuration

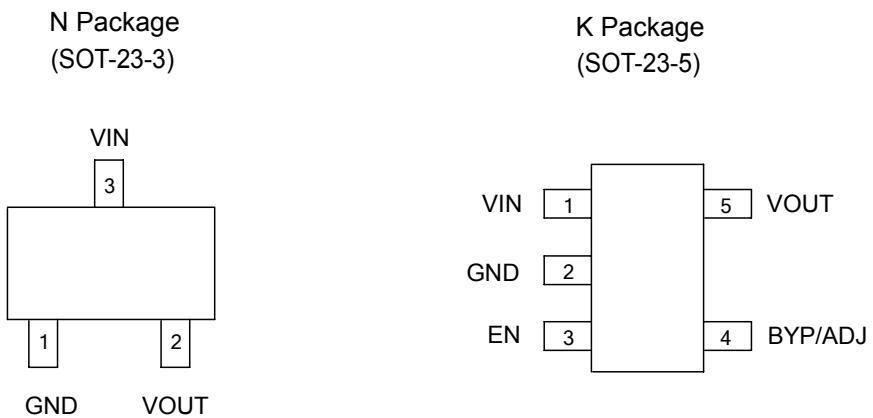

Figure 2. Pin Configuration of AP2210 (Top View)

## Pin Description

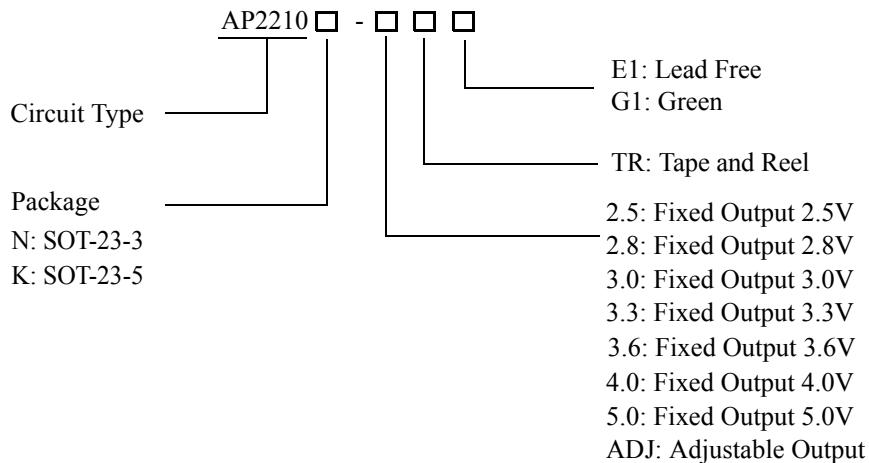

Pin Number		Pin Name	Function
SOT-23-3	SOT-23-5		
1	2	GND	Ground
2	5	VOUT	Regulated output voltage
3	1	VIN	Input voltage
	3	EN	Enable input: CMOS or TTL compatible input. Logic high=enable, logic low=shutdown
	4	BYP/ADJ	Bypass capacitor for low noise operation/Adjustable Output

## Absolute Maximum Ratings (Note 1)

Parameter	Symbol	Value		Unit
Supply Input Voltage	V <sub>IN</sub>	15		V
Enable Input Voltage	V <sub>EN</sub>	15		V
Power Dissipation	P <sub>D</sub>	Internally Limited (Thermal Protection)		W
Lead Temperature (Soldering, 10sec)	T <sub>LEAD</sub>	260		°C
Junction Temperature	T <sub>J</sub>	150		°C
Storage Temperature	T <sub>STG</sub>	-65 to 150		°C
ESD (Machine Model)	ESD	300		V
Thermal Resistance (No Heatsink)	θ <sub>JA</sub>	SOT-23-3	200	°C/W
		SOT-23-5	200	

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

## Recommended Operating Conditions

Parameter	Symbol	Min	Max	Unit
Supply Input Voltage	V <sub>IN</sub>	2.5	13.2	V
Enable Input Voltage	V <sub>EN</sub>	0	13.2	V
Operating Junction Temperature	T <sub>J</sub>	-40	125	°C

## AP2210-2.5 Electrical Characteristics

$V_{IN}=3.5V$ ,  $I_{OUT}=100\mu A$ ,  $C_{IN}=1.0\mu F$ ,  $C_{OUT}=2.2\mu F$ ,  $V_{EN}\geq 2.0V$ ,  $T_j=25^{\circ}C$ , **Bold** typeface applies over  $-40^{\circ}C \leq T_j \leq 125^{\circ}C$  (Note 2), unless otherwise specified.

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Enable Input Logic-low Voltage	$V_{IL}$	Regulator shutdown			0.4	V
					<b>0.18</b>	
Enable Input Logic-high Voltage	$V_{IH}$	Regulator enabled	<b>2.0</b>			V
Enable Input Logic-low Current	$I_{IL}$	$V_{IL}\leq 0.4V$		0.01	1	$\mu A$
		$V_{IL}\leq 0.18V$			<b>2</b>	
Enable Input Logic-high Current	$I_{IH}$	$V_{IL}\geq 2.0V$		5	20	$\mu A$
		$V_{IL}\geq 2.0V$			<b>25</b>	

Note 2: Specifications in bold type are limited to  $-40^{\circ}C \leq T_j \leq 125^{\circ}C$ . Limits over temperature are guaranteed by design, but not tested in production.

Note 3: Output voltage temperature coefficient is defined as the worst case voltage change divided by the total temperature range.

Note 4: Regulation is measured at constant junction temperature using low duty cycle pulse testing. Parts are tested for load regulation in the load range from 0.1mA to 300mA. Changes in output voltage due to heating effects are covered by the thermal regulation specification.

Note 5: Dropout voltage is defined as the input to output differential at which the output voltage drops 1% ( $T_j=25^{\circ}C$ ) or 2% ( $-40^{\circ}C \leq T_j \leq 125^{\circ}C$ ) below its nominal value measured at 1V differential.

Note 6: Ground pin current is the regulator quiescent current plus pass transistor base current. The total current drawn from the supply is the sum of the load current plus the ground pin current.

**AP2210**
**Typical Application**

For Fixed Version

**300mA RF ULDO REGULATOR**
**AP2210**
**Typical Application (Continued)**

$$V_{OUT} = 1.25V * (1 + R_2/R_1)$$

For Adjustable Version

Figure 20. Typical Application of AP2210 (Note 7)

Note 7: Dropout voltage is 250mV when  $T_A=25^\circ\text{C}$ . In order to obtain a normal output voltage,  $V_{OUT}+0.25\text{V}$  is the minimum input voltage which will result in a low PSRR, imposing a bad influence on system. Therefore, the recommended input voltage is  $V_{OUT}+1\text{V}$  to 13.2V. For AP2210-3.0 version, its input voltage can be set from 4V( $V_{OUT}+1\text{V}$ ) to 13.2V.

## 300mA RF ULDO REGULATOR

AP2210

## Application Information

**Input Capacitor**

A  $1\mu\text{F}$  minimum capacitor is recommended to be placed between  $V_{IN}$  and GND.

**Output Capacitor**

It is required to prevent oscillation.  $1.0\mu\text{F}$  minimum is recommended when  $C_{BYP}$  is unused.  $2.2\mu\text{F}$  minimum is recommended when  $C_{BYP}$  is  $100\text{pF}$ . The output capacitor may be increased to improve transient response.

**Noise Bypass Capacitor**

Bypass capacitor is connected to the internal voltage reference. A small capacitor connected from BYP to GND make this reference quiet, resulting in a significant reduction in output noise, but the ESR stable area will be narrowed. In order to keep the output stability, it is recommended to use the bypass capacitor no more than  $100\text{pF}$ .

The start-up speed of the AP2210 is inversely proportional to the value of reference bypass capacitor. In some cases, if output noise is not a major concern and rapid turn-on is necessary, omit  $C_{BYP}$  and leave BYP open.

**Power Dissipation**

Thermal shutdown may take place if exceeding the maximum power dissipation in application. Under all possible operating conditions, the junction tempera-

ture must be within the range specified under absolute maximum ratings to avoid thermal shutdown. To determine if the power dissipated in the regulator reaches the maximum power dissipation (see figure 16, 17), using:

$$T_J = P_D * \theta_{JA} + T_A$$
$$P_D = (V_{IN} - V_{OUT}) * I_{OUT} + V_{IN} * I_{GND}$$

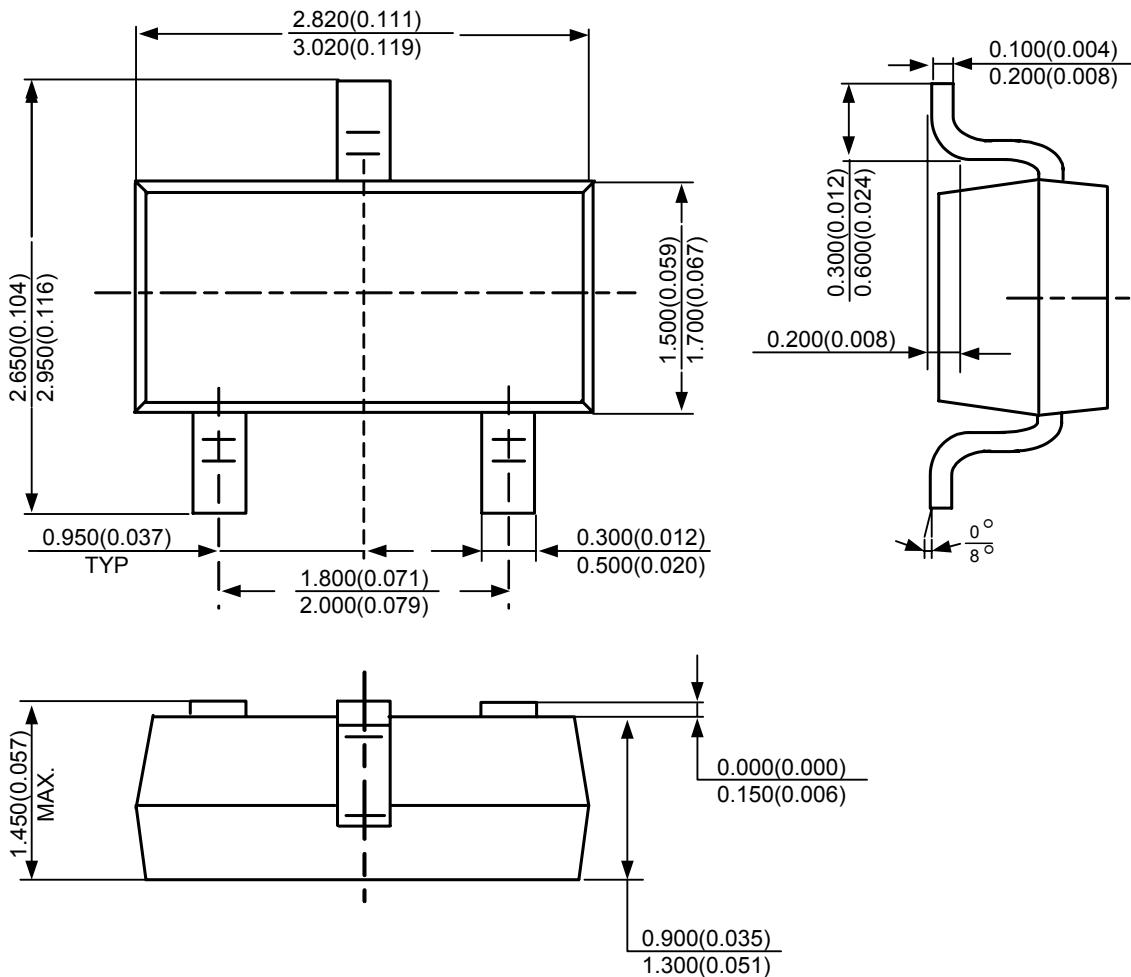

Where:  $T_J \leq T_{J(max)}$ ,  $T_{J(max)}$  is absolute maximum ratings for the junction temperature;  $V_{IN} * I_{GND}$  can be ignored due to its small value.

$T_{J(max)}$  is  $150^\circ\text{C}$ ,  $\theta_{JA}$  is  $200^\circ\text{C/W}$ , no heatsink is required since the package alone will dissipate enough heat to satisfy these requirements unless the calculated value for power dissipation exceeds the limit.

Example (3.0V version):

$$I_{OUT} = 300\text{mA}, T_A = 50^\circ\text{C}, V_{IN(\text{Max})} \text{ is:}$$
$$(150^\circ\text{C}-50^\circ\text{C})/(0.3\text{A}*200^\circ\text{C/W})+3.0\text{V}=4.67\text{V}$$

Therefore, for good performance, please make sure that input voltage is less than 4.67V without heatsink when  $T_A=50^\circ\text{C}$ .
