

6+3 channels PMIC

Features

- 3.0V ~ 5.5V Input Voltage Operation.
- 95% Efficient DC/DC Converter
- Built-in 6-ch synchronous buck converter, 3-ch LDOs
- Bucks and LDOs can be set to lower Iq at low load.
- Buck2, Buck3, Buck5 and Buck6 Supports DVS Function, 12.5mV/step.
- Built-In Power ON/OFF Sequence for PMU.
- Built-In Short Circuit Protection (SCP), Under Voltage Protection (UVP), and cycle-by cycle current limit for DC/DC Converters.
- LDOs are Programmable to Voltage Options by I²C.
- Built-In Thermal Shutdown Function.
- Built-In VCC OVP Function.
- **TQFN5X5-32** Package
- .

General Description

The G2227 provide a complete power supply solution for handsets or data card. It contains 6 dc/dc converters and 3 LDOs to power each critical blocks of mobile phone, and is optimized for maximum battery life, featuring a low ground current when in standby mode operation. All channels DC/DC converters operate at one fixed frequency of 3.0MHz to optimize size, cost, and efficiency. All Synchronous converters operate at pulse skipping mode at light load. The G2227 features a I²C compatible interface.

The G2227 is available in **TQFN5x5-32** package.

Applications

- Mobile Handsets
- TV Dongle
- Smart Phone
- **Set Top Box**

Ordering Information

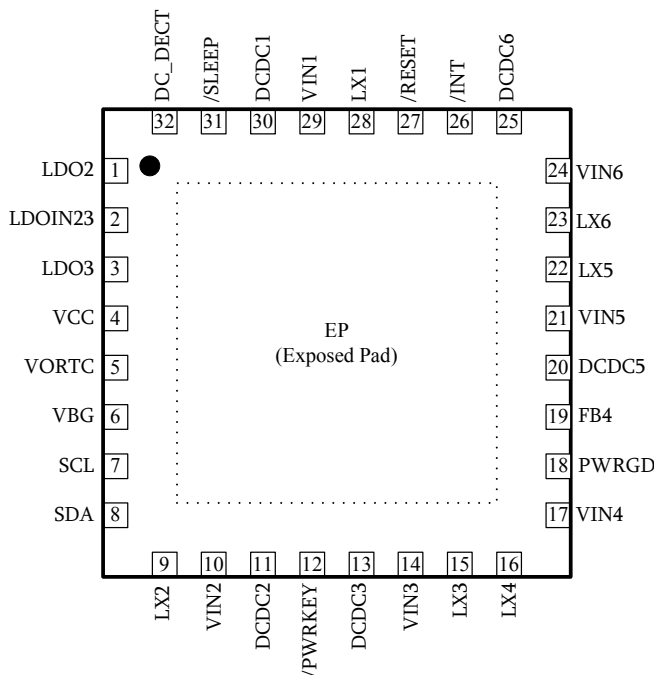

| ORDER NUMBER | MARKING | TEMP. RANGE | PACKAGE (Green) |
|--------------|---------|-------------|-------------------|
| G2227RA1U | 2227 | -40°C~+85°C | TQFN5X5-32 |

Note: **RA:TQFN5x5-32**

Pin Configuration

Absolute Maximum Ratings

VCC, VIN1, VIN2, VIN3, VIN4, VIN5, VIN6, LDOIN23 -0.3V to +6.3V
 DCDC1, DCDC2, DCDC3, FB4, DCDC5, DCDC6, VORTC, LDO2, LDO3 -0.3V to +6.3V
 LX1, LX2, LX3, LX4, LX5, LX6 -0.3V to +6.3V
 Other Pins -0.3V to +6.3V
 Thermal Resistance Junction to Ambient, (θ_{JA})
TQFN5X5-32 TBD

TQFN5X5-32 TBD
 Thermal Resistance Junction to Case, (θ_{JC})
TQFN5X5-32 TBD
 Operating Ambient Temperature . -35°C to 85°C
 Storage Temperature Range. -55°C to +150°C
 Reflow Temperature (soldering, 10 sec) 260°C
 EDS Susceptibility (Human Body Mode) 2kV
 EDS Susceptibility (Machine Mode) 200V

Continuous Power Dissipation ($T_A=25^\circ\text{C}$)

- Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- Device are ESD sensitive. Handling precaution recommended. The Human Body model is a 100pF capacitor discharged through a 1.5K Ω resistor into each pin.

Electrical characteristics

(VCC=VINx=3.7V, LDOINx=3.7V, $T_A=25^\circ\text{C}$, unless otherwise specified)

| PARAMETER | SYMBOL | CONDITIONS | MIN | TYP | MAX | UNIT |
|------------------------------------|-----------------------|---|------|-----|-----|---------------|
| GENERAL | | | | | | |
| VCC Operating Voltage for PMU | V_{VCC_PMU} | | 3.0 | --- | 5.5 | V |
| VCC Over Voltage threshold | V_{VCC_OVLO} | VCC rising | 5.8 | 6.0 | --- | V |
| VCC Under Voltage threshold | V_{VCC_UVLO} | VCC falling | --- | 2.5 | --- | V |
| VCC Under Voltage Hysteresis | V_{VCC_UVLOHS} | | | 300 | | mV |
| PMU Stand-by Supply Current | I_{VCC} | ALL converters enter ECO mode, and without loading current. | --- | --- | 200 | μA |
| OSCILLATOR | | | | | | |
| Frequency | F_{OSC} | DCDC1~DCDC6 | 2.6 | 3.0 | 3.4 | MHz |
| DCDC1 Buck Converter | | | | | | |
| Soft-Start Internal | SS_CH1 | | --- | 2 | --- | mS |

| Fall Time of SCL/SDA signals | t_f | 90% to 10% points | 20 | --- | 300 | nS |

Minimum Footprint PCB Layout Section

Pin Description

| Pin No | Pin Name | Function |
|--------|-------------|--|
| 1 | LDO2 | LDO Output of LDO2. |
| 2 | LDOIN23 | Power Input of LDO2 and LDO3. |
| 3 | LDO3 | LDO Output of LDO3. |
| 4 | VCC | IC Power Supply Input pin. Bypass with a 10uF or greater ceramic capacitor. |
| 5 | VORTC | LDO Output of RTC LDO. Bypass this pin to ground with a 2.2uF ceramic capacitor. |
| 6 | VBG | 1.23v Reference Voltage Output. Bypass this pin to ground with a 0.47uF ceramic capacitor. |
| 7 | SCL | Clock Input PIN of I ² C interface. |
| 8 | SDA | Data Input PIN of I ² C interface. |
| 9 | LX2 | Inductor switch node of DCDC2 Buck Converter. |
| 10 | VIN2 | Power Input of DCDC2 Buck Converter. |
| 11 | DCDC2 | Sensing Input of DCDC2 Buck Converter's output voltage. |
| 12 | /PWRKEY | Power on/off key. Internal pull high to VCC. |
| 13 | DCDC3 | Sensing Input of DCDC3 Buck Converter's output voltage. |
| 14 | VIN3 | Power Input of DCDC3 Buck Converter. |
| 15 | LX3 | Inductor switch node of DCDC3 Buck Converter. |
| 16 | LX4 | Inductor switch node of DCDC4 Buck Converter. |
| 17 | VIN4 | Power Input of DCDC4 Buck Converter. |
| 18 | PWRGD | Indicator of PMU power on/off with open drain output. |
| 19 | FB4 | Feedback Input of DCDC4 Buck Converter. |
| 20 | DCDC5 | Sensing Input of DCDC5 Buck Converter's output voltage. |
| 21 | VIN5 | Power Input of DCDC5 Buck Converter. |
| 22 | LX5 | Inductor switch node of DCDC5 Buck Converter. |
| 23 | LX6 | Inductor switch node of DCDC6 Buck Converter. |
| 24 | VIN6 | Power Input of DCDC6 Buck Converter. |
| 25 | DCDC6 | Sensing Input of DCDC6 Buck Converter's output voltage. |
| 26 | /INT | Interrupt Indicator with open drain output. |
| 27 | /RESET | RESET PIN of G2227. Internal pull high to VCC. |
| 28 | LX1 | Inductor switch node of DCDC1 Buck Converter. |
| 29 | VIN1 | Power Input of DCDC1 Buck Converter. |
| 30 | DCDC1 | Sensing Input of DCDC1 Buck Converter's output voltage. |
| 31 | /SLEEP | SLEEP mode control pin. Internal pull high to VCC. |
| 32 | DC_DECT | DCIN Input PIN. |
| EP | AGND, PGNDX | All converters' power ground and chip analog ground. For good thermal dissipation, connect EP to the power and analog ground plane. |

Block Diagram & Application Circuit

I2C Interface

G2227 I2C slave address=7'b0010010. The write or read bit stream (N≥1) is shown below:

- Driven by Master
- Driven by G2227
- S Start
- P Stop
- Sr Repeat Start

Read N bytes from G2227

Write N bytes to G2227

| | | Read/Write | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| 0x20 | VERSION | Meaning | CHIP_ID[4:0] | | | | VERSION[2:0] | | | |
| | | Default | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 0 |
| | | Read/Write | R | R | R | R | R | R | R | R |
| 0xF1 | GMT Testing | Meaning | | | | | TM[5:1] | | | |
| | | Default | | | | | 0 | 0 | 0 | 0 |
| | | Read/Write | | | | | R/W | R/W | R/W | R/W |

I2C Register Reset Conditions

| ADDR. | Register Function | Rest Condition |
|-----------------|---|---|
| 0x00 | Interrupt Registers | VCC<1.3V, or the power-off reset pulse. Also reset by reading them |
| 0x02 | Power-key IT/LP/LPOFF Registers | VCC<1.3V, or the power-on leading pulse |
| 0x03,0x04[3] | DCDC&LDO Fault Status | VCC<1.3V or 0x04[3] is written to 1 |
| 0x04[7] | SOFTOFF | VCC<1.3V, or the power-on leading pulse |
| 0x06 | DCDC and LDO enable discharge Registers | VCC<1.3V, or the power-on leading pulse |
| Other Registers | | VCC<1.3V, or the power-off reset pulse. |

I2C Register Function Table

Interrupt and Status

| ADDR | Data Bit | Data Name | Function Description | | | | | | |
|-----------|--------------------------|-------------|--|-----------|--------------------------|---|------|---|-----|
| 0x00 | b7 | INT | <p>INT is used to control the output status of /INT pin. When interrupt events happen, /INT pin goes low and this bit is set to 1'b1. After Micro-processor write the bit to be 1'b0, /INT pin goes to high-Z state.</p> <table border="1"> <thead> <tr> <th>INT</th> <th>/INT Pin Status</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Hi-Z</td> </tr> <tr> <td>1</td> <td>Low</td> </tr> </tbody> </table> | INT | /INT Pin Status | 0 | Hi-Z | 1 | Low |

FUNCTION DESCRIPTION

PMU

The G2227 includes six DC/DC Converter, and three LDO regulators to generate a multiple-output power-supply system.

| | Topology | Default V_{OUT} | V_{OUT} range | Current rating | ON/OFF Control |
|-------|---------------------------|-------------------|--|----------------|-----------------------------------|
| DCDC1 | 3MHz Sync. Buck Converter | 3.3V | 4-steps voltages from 3.0v to 3.3v configured by I ² C | 2.0A | Controlled by register bit ONDC1 |
| DCDC2 | 3MHz Sync. Buck Converter | 1.0V | 32-steps DVS from 0.8v to 1.1875v configured by I ² C | 3.0A | Controlled by register bit ONDC2 |
| DCDC3 | 3MHz Sync. Buck Converter | 1.0V | 32-steps DVS from 0.8v to 1.1875v configured by I ² C | 2.0A | Controlled by register bit ONDC3 |
| DCDC4 | 3MHz Sync. Buck Converter | 1.5V | Configured by FB4 pin resistors. | 2.0A | Controlled by register bit ONDC4 |
| DCDC5 | 3MHz Sync. Buck Converter | 1.0V | 32-steps DVS from 0.8v to 1.1875v configured by I ² C | 2.0A | Controlled by register bit ONDC5 |
| DCDC6 | 3MHz Sync. Buck Converter | 1.0V | 32-steps DVS from 0.8v to 1.1875v configured by I ² C | 2.0A | Controlled by register bit ONDC6 |
| LDO1 | RTC LDO | 3.1V | 4-steps voltages from 3.0v to 3.3v configured by I ² C | 50mA | Always ON |
| LDO2 | pMOS LDO | 1.8V | 16-steps voltages from 0.8v to 3.1v configured by I ² C | 600mA | Controlled by register bit ONLDO2 |
| LDO3 | pMOS LDO | 0.9V | 16-steps voltages from 0.8v to 3.1v configured by I ² C | 600mA | Controlled by register bit ONLDO3 |

DCDC4 Output Voltage Setting

The output voltage of DCDC4 is decided according to the resistor R_{UP} connecting between FB4 to converter's output voltage, and the resistor R_{DN} connecting between FB4 to ground. The suggesting resistance of R_{DN} is 160k Ω .

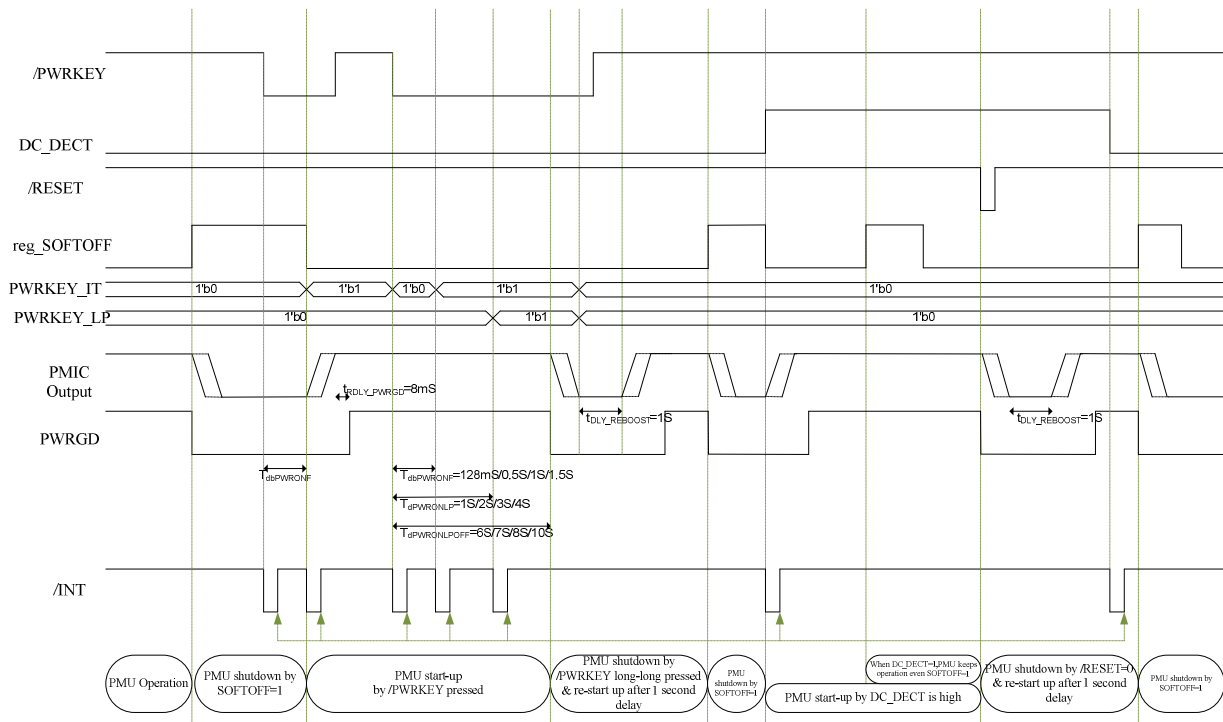

PMU Power ON/OFF Initiation

The following conditions are available to turn on the PMU of G2227:

- /PWRKEY is low-level pressed with duration longer than $T_{dbPWRKEYF}$
- After 1 second delay from shutdown of G2227 caused by /PWRKEY is long-long pressed with duration longer than $T_{dPWRKEYLPOFF}$, and register ENLPOFF=1'b1, LPOFF_TO_DO=1'b1.
- After 1 second delay from shutdown of G2227 caused by toggling /RESET low.
- The voltage applied in DC_DECT pin is higher than V_{DCDET} (1.2V typ.)
- The voltage applied in VCC pin is higher than $V_{VCC_UVLO}+V_{VCC_UVLOHY}$ (2.8V typ.)

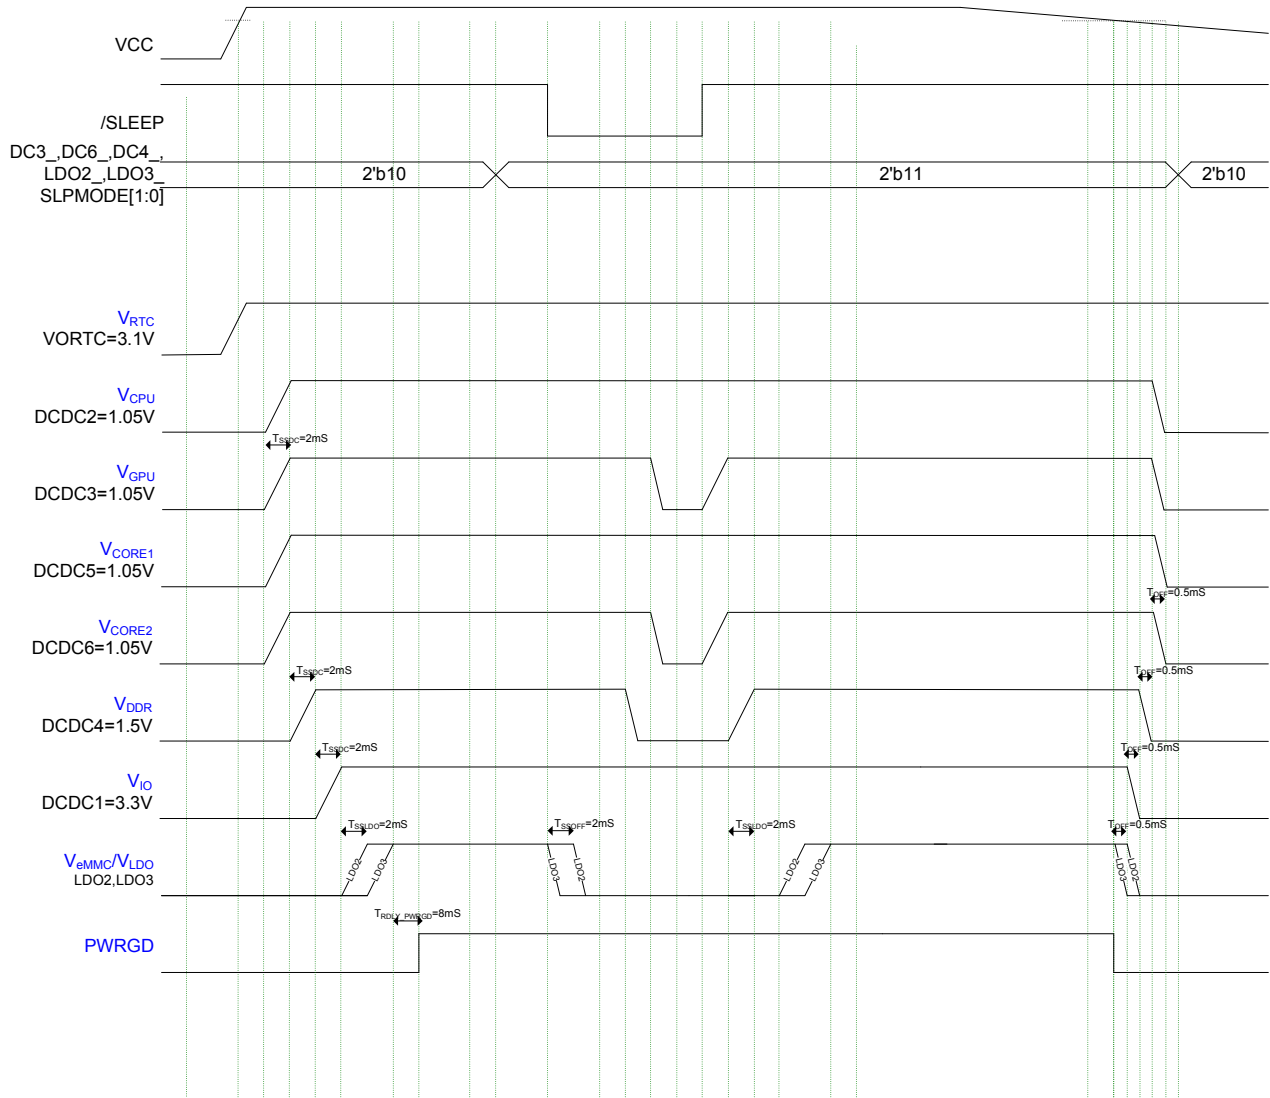

The following conditions are available to turn off the PMU of G2227:

- /PWRKEY low-level pressed with duration longer than $T_{dPWRKEYLPOFF}$ (if ENLPOFF=1'b1)
- Write 1 to register SOFTOFF after PWRGD is turned high and DC_DET is low.
- /RESET is toggle low.
- Output voltage UVP of DCDC converters occurs with duration longer than 128ms
- G2227 thermal shutdown occurs.

PMU Power ON/OFF Sequence

When the power on condition is met, these six DC/DC converters, LDO2, and LDO3 start up in sequence. After these converters finish power on sequence, the open-drain output PWRGD is high with 8ms time delay from LDO3 is power ready. When G2227 enter sleep mode controlled by toggling /SLEEP pin low, PWRGD pin keeps high, and all converters' on/off mode is according to the setting of SLPMODE[1:0].

PMU Fault Protection

G2227 PMU provides VCC over voltage protection, over-current protection, under-voltage protection, short-circuit protection, and thermal shutdown protection to achieve complete protection.

| | Protection type | Threshold | Protection methods | Reset Method |
|------------|-----------------|---------------------------------|-----------------------------------|---|
| VCC | OVP | $VCC > 5.8V$ | IC shutdown | Reset by toggling EN_MAIN |
| DCDC1 Buck | Current Limit | pMOS current $> 2.5A$ | pMOS Off, nMOS on | Automatic Reset at next cycle |
| | UVP | $VOUT1 < 75\% * VOUT_{SET}$ | IC shutdown if period above 128ms | Reset by the power- on/off initiation conditions |
| DCDC2 Buck | Current Limit | pMOS current $> 3.5A$ | pMOS Off, nMOS on | Automatic Reset at next cycle |
| | UVP | $VOUT2 < VOUT_{SET} - 100mV$ | IC shutdown if period above 128ms | Reset by the power- on/off initiation conditions |
| DCDC3 Buck | Current Limit | pMOS current $> 2.5A$ | pMOS Off, nMOS on | Automatic Reset at next cycle |
| | UVP | $VOUT3 < VOUT_{SET} - 100mV$ | IC shutdown if period above 128ms | Reset by the power- on/off initiation conditions |
| DCDC4 Buck | Current Limit | pMOS current $> 2.5A$ | pMOS Off, nMOS on | Automatic Reset at next cycle |
| | UVP | $VOUT4 < 90\% * VOUT_{SET}$ | IC shutdown if period above 128ms | Reset by the power- on/off initiation conditions |
| DCDC5 Buck | Current Limit | pMOS current $> 2.5A$ | pMOS Off, nMOS on | Automatic Reset at next cycle |
| | UVP | $VOUT5 < VOUT_{SET} - 100mV$ | IC shutdown if period above 128ms | Reset by the power- on/off initiation conditions |
| DCDC6 Buck | Current Limit | pMOS current $> 2.5A$ | pMOS Off, nMOS on | Automatic Reset at next cycle |
| | UVP | $VOUT6 < VOUT_{SET} - 100mV$ | IC shutdown if period above 128ms | Reset by the power- on/off initiation conditions |
| LDO2/3 LDO | Current Limit | pMOS current $> 600mA$ | | pMOS current $< 450mA$ |
| | UVP | $VOUTX < 12.5\% * VOUTX_{SET}$ | pMOS Off | Reset by the power- on/off initiation conditions, or I ² C ONLDO control |
| Thermal | TSD | Junction Temp. $> 150^{\circ}C$ | IC shutdown | Reset by the power- on/off initiation conditions |
